3609. Kenwood TS140 repair

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-16 17:19:17 UTC
From: harrison@calvin.jci.tju.edu
Message-ID: <32qsel$m0v@elmo.tju.edu>
Source record: 224832

My TS140 has bitten the dust, with an intermitant, now nearly
permanent "unlocked" message. (actually ..- -. .-.. --- -.-. -.- . -.. ;-))
Presumeably a vco or PLL has gone south, although the unit is old
enough for battery death.

Does anyone know of a good repair shop in the general Philadelphia
area (max 1-2hour drive)? or should i just ship the unit back to kenwood?

Do the extended RX only mod instead (jumper 15 instead of 13). OR,
store a split TX frequency in each out-of-band memory. So, if you
have 460.25 (a common PS freq.), then store 446.0 as a TX frequency
entered as a non-standard offset.

>2. I'm concerned about how quickly the battery runs down. I got a little
>slip with the unit that says that the voltage display is .2 to .8 volts

>volts even though (I presume) the actual voltage is a little higher. When
>transmitting, the battery voltage can dip significantly and cause the
>battery low indicator to flash. Is this the time to recharge or should I
>wait until the battery is low when receiving?

Yes, the voltmeter in the Yaesu is not very accurate. It is accurate
near 12 volts, but the linearity gets much worse as one goes down in
voltage. My advice. Measure it. When the battery voltage falls near
5.5 volts (true) during Tx, charge it. Otherwise, you risk reversing
the weakest cell during Tx. If you wait until it hits 5.5 volts during
Rx, you will definitely have reversed cells during Tx, where the current
and voltage drop are much higher.

>3. I'm using all the battery saving functions and I'm wondering if they
>really do make a difference.

Rx save or ABS does work. Radio will standby for hours and hours.
Tx save is a pain. Unfortunately, ham radio doesn't have two way
power control (i.e. base or repeater can't tell the HT how well
it's signal is being heard) unlike cellphones which do have full
power control. Yaesu does it by listening to the repeater signal.
Unfortunately, the system is very asymmetrical, with the repeater
putting out anywhere from 10 to 20 dB more power than the HT. So
even if the HT hears the repeater full squash, the repeater may not,
and the HT may falsely drop power. Also, during marginal conditions,

it is annoying for the person on the other end to hear the noise floor
go up and down in between your words as the Tx save dynamically adjusts
power.

>4. Are there any cheap alternatives to buying Yaesu batteries/chargers
>for the FT-530?

The following is at your own risk:

Get an FBA-12 and stuff Ni-Cds in it. Be careful to put a separating
sheet to prevent cell to cell shorts. Convince yourself why this sheet
is necessary.... (the jacket on most NiCds can wear off)

>5. What kind of antenna can I replace the standard one with to improve my
>transmit (instead of increasing wattage)?

The standard one (YHA-29) is pretty good. Unless you're willing to go
with a much larger antenna, you may be out of luck. Diamond/Comet/Anli
make duckies that are about 18" long ($30) that have about 3 db more
of gain (3db less loss???? :-) AEA makes hot rods for 2m, but not
for 440 -- they work great, but they are long and inflexible.

3611. Capacity of Alkaline batteries?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-16 17:53:18 UTC
From: garym@alsys.com
Message-ID: <Cun30u.Jry@alsys.com>
Source record: 224835

Has anyone measured the amp-hour capacity of typical D or AA alkaline batteries? Also, what would be the maximum available current from D or AA alkaline batteries? Actual data or references to books or articles would be very helpful.

I'm interested in their capacity for use to power emergency radio equipment, such as handheld radios or portable low-power repeaters.

They have several advantages over Gel-cells or Nicads for emergency use, long shelf life, and you don't have to charge them in the field and they are readily available at fire camps.

Thanks,
--GaryM

Hello, I have a Rohn HBX32 tower for sale. This is a 32' self-
supporting steel tower. It is in excellent condition and includes
all hardware, expect for base stubs. It comes in 4, 8 ft sections,
which can be stacked inside one another for easy moving/storage.
It is rated for a 10 sq.ft. antenna windload @ 70mph winds.

I'd like to get $200 for it, or best offer.
(Texas Towers sells them locally for $275)

Please email to 'debaker@bnr.ca' or call 214-684-7351 (day)

AA = 2.2 Ah, D = 15.2 Ah

Internal resistance becomes a problem for currents in excess of 750 mA
for AA and 3 A for D.

>I'm interested in their capacity for use to power emergency radio equipment,
>such as handheld radios or portable low-power repeaters.

As long as the current drain is not excessive, they are good choices.
AA Lithium has a very long shelf life and can source 2A, but are expensive.

Battery manufacturers (i.e. Duracell, Eveready, etc.) have data books for design engineers which has the data that you are looking for. However, these data books are generally difficult to find unless you are either designing a product which uses lots of batteries or you are willing to pay $$.

An alternative is a simpler battery data book at Radio Shack (Enercell Battery Guidebook, RS62-1304, $5.99).

3620. ADVICE on NEW HF rig wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-16 23:53:02 UTC
From: robin@oleum.zso.dec.com
Message-ID: <32rjgu$dq6@usenet.pa.dec.com>
Source record: 224843
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Hi,

I have been out of the HF rig buying scene for about 10 years, since I have never had any reason to update my ageing FT301D. However in view of the VAST differences between UK and US pricing, I think it`s time to make the change.

Does anyone have any recommendations/reviews on the more popular HF rigs, I particularly like the look of the TS-50, primarily as I like to do HF mobile work. A friend also said the Ts850 or 450 were 'good'.

Since I am not a code operator some of the bells and whistles may not be applicable.

I realise that this is a vast subject but am primarily I guess looking for personal experiences, reliablity is also a prime concern as I will be taking it back to the UK soon.

Thanks

Robin

>I've noticed that Tucker seems to have well spec-ed used scoped at fairly
>good prices. Are there any catches with their equipment / scopes that I
>should be aware of as a novice tinkerer?
>

Anyone thinking of buying a used 'scope should ask themselves "What
about probes". This essential component of a 'scope has a tendency
to get lost. Tucker will sell you a 'scope, guarantee it to work,
and give you a copy of the manual but you may not get any probes with it.

Tucker does have probes available but they are not original equipment.
New probes from Tek' or HP are expen$ive. Probes also show up at
hamfests, both used Tek' probes and new Brand X ones.

Tucker sells (or did sell) used equipment in a couple of different
grades. Something like "as-is bargains" and "checked out" (or
something like that). I think they had the same warranty (90 days)
but you could expect some difference in quality. You might want
to ask.

Another problem with Tucker is price. You should consider their
prices as upper limits. You can go to a hamfest (or look here
in r.r.s) and find various individuals and dealers selling the same
things at lower or much lower prices. Some of the dealers check
out their equipment, others just sell what they find, so you need
to know who you are dealing with. If you buy from Tucker you are
paying for risk reduction. A "novice tinkerer" might want that.

My experience is somewhat limited, there is probably someone
out there who can add more....

You might start off with the battery guidebook available at Radio Shack.

You can also get data from the manufacturers as well, but this is more work for most people. The amp hour rating isn't terribly useful with alkaline cells--quite a bit of dependence on how you take the power out of the cell.

As a rough guideline, if you aren't taking too much out at once, you can probably get 4 or 5 times the cycle lifetime (except you just get one cycle out of the non-rechargeable ones) out of an alkaline as compared with a Nicad. On the other hand, you typically can only get a tenth or so of the maximum current--Nicads are really good at high current application.

It is important to have a radio designed for alkalines--if you want to make best use of them. Radios like the FT-290 and IC-202 used 9 alkaline cells--you start around 13.5 volts and you toss the cells when they drop below 8 or 9 volts. If your transceiver needs 11 or 12 volts minimum alkalines probably aren't worthwhile. Fortunately, most HTs accomodate such a wide voltage swing as well.

From: Tom WB7ASR <tom_boza@ccm.hf.intel.com>
Message-ID: <32t97o$h80@chnews.intel.com>
Source record: 224899
Cross-posted to: sci.electronics,rec.radio.swap,rec.radio.amateur.swap,rec.radio.amateur.space,rec.radio.amateur.misc,rec.radio.amateur.homebrew,rec.radio.amateur.equipment,rec.radio.amateur.antenna

Im rebuilding the phaseing delay lines for my KLM amateur satellite yagis and need to located a source to acquire about ten feet of RG-302 75 ohms and ten feet of RG-303 50 ohms, teflon coax cable.

RG-302 & RG-303 both have teflon dielectric and a silvered copper shield, both have inner conductors of silver-plated copper-plated steel. They are designed for high-temperature operation. I suspect they were selected by the antenna manufacturer because of low temperature coefficients. I don't want to use Radio Shack 75 ohm TV cable.

Different velocity factors between teflon and polyethylene.

polyethylene = 66.5% teflon = 69%

KLM sells the complete phaseing kit replacements for $49 each, however I feel I should be able to replace just the coax for at least half that price.

If anyone knows of a source for RG-302 & RG-303, please post here or reply via eMAIL direct.

Thanks and 73s,
Tom - WB7ASR... (not speaking for Intel)

I AM LOOKING FOR A SMALL RADIO TO USE WHEN TRAVELING. NEEDS TO FIT IN MY BRIEFCASE. I WANT TO LISTEN TO SW BROADCAST AS WELL AS HAM RADIO NETS ON SSB.
DOES ANYONE HAVE ONE OF THESE AND ANY COMMENTS ABOUT THE RADIO FOR THE ABOVE USES WILL BE APPRECIATED.

LARRY NI4K@AOL.COM

3633. ICOM IC-737 vs IC-736

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-17 20:43:05 UTC
From: terry@venus.sunquest.com
Message-ID: <32tsop$kv5@odin.sunquest.com>
Source record: 224907

I've looked carefully at the ad for the new IC-736 HF+6m transceiver from ICOM. I've compared the photo with my IC-737; if there's a difference, I didn't notice it.

Does anybody know how different the 736 and 737 are, internally? If I want 6m, am I really going to have to trade in my 737 for the outwardly-identical 736? Might the difference just be software and a module?

OTOH, is there anything missing from the 736 that the 737 has? I depend on my 737 as a general-coverage receiver, for example ...

AdTHANKSvance for any info.

3634. Yaesu FT530 vs Icom W21AT - A summary of opinions

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-17 21:05:44 UTC
From: chennu@ichips.intel.com
Message-ID: <CHENNU.94Aug17140545@pdxcs070.ichips.intel.com>
Source record: 224910

My original post was

In article <CHENNU.94Aug15131245@pdxcs037.ichips.intel.com> you wrote:
: Hi,
: As the subject says I am considering purchasing a dual-bander HT.
: I would like to get the opinions of those who have used them.
: Any recommendations would hbe welcome too.
: HRO has the Yaesu for 449.95 & the Icom for 434.95

Here are all the responses I got

From George Guillory, KC5HBT
guillory@blkbox.com

I investigated both before my purchase of a W21AT.
I used several (including the Yaesu) that other people owned at
local ham club meeting. While most people owned others the only
gripe they had about the W21at was that it looked weired. (Too modern
for them I guess.) They never griped about performance.

Some things I like about my W21AT:
I like the fact it is also a general coverage receiver all the way
up to 900mhz. Several of my favorite "cop" frequencies are in it as
well as the relay of the local radio news channel to its tranmitter
tower.

I like the fact that you can buy the optional "empty" battery case
the BP-130. With this case you can load up your own ni-cads or
alkaline batteries. This allows you to buy a nicad charger cheaper
than you can buy ICOM's very expensive charger.

I like the ability to put the W21AT in a mini-repeater mode.

I like the smaller size. Other brands are not far behind but the
smaller the radio is the more likely you are to carry it.

I like the ability to use "wisper"mode. Although I havn't used it
yet.

You can alway call 1-800-USA-ICOM and talk to a tech rep anytime. They
will even answer stupid questions!

Mine one grip: It uses a special &^$%#&!! power cord! The plug (which
is only available from ICOM) on a pigtail is $14! I do like
the special filtered cigarette power cord though for $24.

I say buy the one the guy offers you!

##

From Randy Petersen
KE6IZZ
drp@netcom.com
I have the Icom W2A which is very similar. It is 2meter and 70cm.
It has extended receive of 108 to 174 and 300 to 500, with a
UHF hi of 800 to about 900 mhz. It can be modified to transmit
on CAPS and MARS frequencies Marine etc. Great HT. HRO is closing
out for about $390. I would recommend highly.

##

From Dick Kriss, kd5vu
I shopped the HT's and purchased the FT-530 and it is the BEST
radio I have every owned. Too bad Yaesu does not make a mobile
rig with the FT-530 features.

I have owed Icoms (not the w21at but others). Check the 4-Sale
ads....you will see all kinds of Icoms up 4-
Sale and never see a FT-530 for sale. Think about it!

##
From Doug Hamilton KD1UJ hamilton@bix.com

Until recently, it certainly looked like the Yaesu FT-530 was the one
to beat. But I think if I were going to buy a dual-bander today, (and
indeed, I have been thinking about it :-) I think I'd go with the new
Kenwood TH-79A. Frankly, the alphanumeric display, which lets you
program in names for the frequencies in the memories looks like a
real winner. Too, I think I've always thought the Kenwoods have had
somewhat nicer cosmetic design. Price of a 79A should be in the same
ballpark (maybe +$25) as the other units you're considering if you
shop carefully.

##

From Ken Nishimura
Shop around -- check out the mail order joints. $450 for the 530
is WAY too much.

==ken
##

From gianotti@aol.com

have both radios . . . and the ICOM is up for sale! The ICOM looks
nicer than the 530 but that is all. The ICOM has terrible audio on
receive (due to the lack of speaker), the buttons are too small to hit one
and a time, the display is poor in good light and worse even with the
built-in night light, the small antenna is next to a dummy load.

The 530, to my mind, is a much better radio, while it may not look as
sexy, it is much more user friendly to use and program.

73

##

And poor ole me is as confused as ever. :-) However I am definitely
leaning
towards the FT530.

Thank you one & all for youe helpful input

Srinivas

I am a ham and have recentley "aquired" a 80 ft. Pyrod self-supporting tower Being that I am in college and will probably move fifteen times before I find a place that I like I have decided to sell the BEAST. The tower doesn't even know the word rust and is in exceptional shape. Obviously this is commercial grade, but I wanted to talk to someone who knew what this maybe worth to a buisness or a serious ham. There is also two 18 ft. omnidirectional antennal on the tower including two side brackets and three pieces of half inch or larger hardline 100 + ft. I am located in Indianapolis and so is the tower, any reasonable offers are welcome but I am mainly looking for some advice at this time.

Thanks to all who reply, Jabran - N9KZA

3636. Soldering Station info

Newsgroup: rec.radio.amateur.equipment

I just bought a soldering station w/ a digital temperature display. The main reason I got it (other than the gee whiz nifty thing) is that it had some really fine tips available for it and I was planning on doing some computer board work & possibly some SMD work with it.

My question is this: What temperature is equivalent to a 15W "low power" soldering iron (yeah, the blue one from Radio Shack)?

How about the standard 30W iron?

The temp ranges on the unit are from 320-840 degress F or so.

Thanks,
Brendan.

>features - our local dealer had a fax that documented these new features, but
>when I asked to see it, they couldn't find it.

I would like to see that also.

On another topic, has anyone ever succeeded in controlling the 742A by
remote control from another radio? I tried following the instructions in
from Kenwood (which I got when someone posted them here on news) but it
didn't respond to the commands. It works OK using the remote control
instructions in the owners manual, but those only let you remote control it
from the microphone (not very useful).

Source record: 224917

I am interesten in purchasing a TH-79A in the near future.
Unfortunately the unit is new, so I am not aware of any modifications
other than the MARS/CAP. The people at Kenwood did not know of any
other mods than the MARS/CAP for both the 79A AND 78A, which we know
there are more for th 78A.
I would like anyone who knows of modifications for the 79A to please
E-mail me! I am interested in Extemted Rx, 800Mhz especially.

Thanks!

I need some info on mods for the FT-470. I know that the
pads for R66, R67, R68 and R69 are used for assigning the VFH
band coverage.

What about the two pads just below R66. Should these have jumpers ? What do
they do ? Volume 6A ob the Radio Tech Mods manual shows these two jumpers
installed. The radio I have does not have them. It also doesn't work.

Anybody know the answer ?

: I am in the market for a quality HF receiver and have an opportunity to
: purchase a JRC NRD-525. I would like to know how this receiver
: compares against receivers like the Icom R71A and Kenwood R5000.

I have a 535D and had an r5000. For ham band listening the r5000 was great,
but IMHO the NRD is significantly better.

I would go for the non "D" model 535 first and then the 525 second.

If you want filters buy the OEM ones as the Japan Radio ones don't seem to
have a great slope factor.

73,

Geoff.

3645. Kenwood TM-733A undocumented functions.

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-18 00:44:51 UTC
From: steve@vigra.com
Message-ID: <STEVE.94Aug17174451@susie.vigra.com>
Source record: 224918
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I just talked to Kenwood and found out a few new things about the
TM-733A. I haven't tried most of these yet (because my radio is all
taken apart), but I'll pass the info along.

////
The extended range modification:
They *do* have an official extended range modification, but they will
not send it to you unless you first send them proof of MARS or CAP
enrollment. I tried to explain to them that I want to transmit into
the hamsats at 435 MHz, but they didn't care.

////
The official word on the dirty CTCSS tones is that it's still an
unknown problem, and there is no Service Bulletin to correct it. If
enough people notices the grunge in the outgoing tone and call them
about it, maybe they will check into it.

////
The partially-documented "External Remote Control Operation" is
documented in App Note AAN-0006. Some people have found that when
remote control is enabled, the microphone is hot and will hear DTMF
tones coming from the speaker if the volume is turned up and the mic
is near.

To remote-control the radio with the microphone disconnected (yeah!),
they offer this procedure:
- Pick a UHF control frequency.
- Turn on the UHF DTSS function and select a tone sequence.
- Turn the UHF DTSS function back off.
- Press Band Select to move to the VHF band.
- Turn OFF the radio, press and hold the [CONT SEL] key, turn on the
radio, and then release the cont key. This will place you in the
EXT standby mode. The S-meter scale and the DT indicators for the UHF
band will begin flashing ON and OFF. The LOCK indicator will turn ON,
and most front-panel keys (PWR stays) will be disabled.
- To begin remote control, you should key the external radio and
press the following key sequence: "Axxx#" where "xxx" is the preset
DTSS code selected earlier.
- If the proper code is received by the 733, the beeper will sound and
the "DT" indicator will stop flashing. The radio can now be
remote-controlled, using the function chart in the manual (p. 81?).
- The return to standby mode, press "A#" on the remote radio.
- To return the radio to normal operation, turn the radio off, then
press and hold [CONT SEL] while turning the radio back on. Repeat

one more time. (really!)

Wow! I would have never figured this out on my own. I was beginning to think that the acoustic-coupled mic/speaker was the only way to remote control it.

My reading of the instructions is that it starts off the remote control mode "locked", which is a good idea. You can then unlock and relock it with the DTMF code sequence. Pretty cool.

////
The advertised but undocumented Wireless Clone function is described in App Note AAN-0008 which they will mail out on request. (Maybe if enough people ask for it, they will include all the functions in future instruction manuals.) In summary:
- Prepare the two radios for simplex operation on the same frequency.
- Turn both radios off
- Press [CALL]+[SHIFT] + [Pwr On].
- This should place the radios is clone mode with "CLonE" on the display.
- Press PTT on the "Master" radio momentarily. This will start sending the programming DTMF tones.
- After all data has been transferred, the display of all radios will read "End", indicating success.
- If the signal is interrupted or corrupted, the "Slave" displays will read "Err". Turn them off and try again.
Notes:
- Both the Master and Slave radios must have the same number of memory channels available for each band. Example: You can not clone a stock Master to a Slave with ME-1 memory expantion.
- You can not clone between different Kenwood radio models, even if they seem identical.

////
The advertised but undocumented cross-band repeat function is described in App Note ANN-0009. Most people have already figured this one out.

Basically, you set up the VHF and UHF bands, then select the "X" icon from the [F](for 1 second) menu. For bi-directional repeater operation, make sure the PTT and Control bands are different, usually by pressing Cont Sel once. If the PTT and Control indicator are on the same side, then it will only retransmit the other band to that side (for one-way extender operation). All the decimal points will light up when in repeater mode. The remote control sequence to turn on/off repeater mode is "DC".

The transmitter hang time can be toggled between 500ms to 0ms by turning on the radio with [LOW] pressed. They also recommend enabling the Time-out Timer, for obvious reasons.

////
The "Assembly Mode" for testing the control panel indicators, buttons,

and knobs is documented only in the Service Manual. I posted a summary a few days ago.

////
So, there you have it! When I get the mods all figured out and tested, I'll try to post a full report with details on all the undocumented features and the mods. This should end up in the archives somewhere.

Happy Hacking!
-Steve

3647. ICOM IC-2iA info!

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-18 01:43:12 UTC
From: rjcress@cyberspace.com
Message-ID: <32uebg$4hh@cyberspace.com>
Source record: 224916

iCOM IC-2iA 2m HAM radio specs/info/opinions
by: rjcress@cyberspace.com

First off, this is one *small* radio... yet perfect for the hand. The overall feel when hold the radio is comfortable, more so when you've got the hand-strap on... So as for short opinions, I like the radio, and is perfect.. except: I don't know the mods for it... does it have extended RX/TX, I doubt it, but possible, does it have 440 receieve mods? If you have any of this info, please post it here, or email: rjcress@cyberspace.com

Features:

comes with: handstrap (string-type), Antenna (6-7" rubber duck type), wall charger (will charge or run, but I wouldn't suggest TXing w/ the charger plugged in), metal beltclip and screws, and a slide in battery pack (7.2V / 400 mAh).

Has four TX power settings:

HIGH 5.0W/13.8V 1W/7.2V
LOW3 2.5W/13.8V 1W/7.2V
LOW2 500mW/13.8V 500mW/7.2V
LOW1 20mW/13.8V 20mW/7.2V

Has a 24-hr system clock (and w/ it's small size, it's now my new watch! <G>), 2 scan types: Programmed scan (from low freq to high freq, then jump back) and Memory Scan (scans memory channels, can have skips and masks), 2 seperate modes: Easy mode (which is what the scanner looks like) and then the Multi-Function Mode (this completly changed my perception on the radio)

Ok, overview on the subtle AI Multi-Function mode:

I/S functions: memory skip and mask functions, 100 memory channels.
C functions: programmed scan, memory scan, and programmed skip scan, clock setting, power-on, power-off, auto power-off.
E functions: subaudible tone encoder, pocket beep, and tone squelch, tuning steps (5, 10, 12.5, 15, 20, 25, 30, 50kHz), duplex.
S functions: PTT lock, confirmation beep, RX indicator, LCD lighting timer (yep, you can make the light stay on!), LCD contrast, power saver duty cycle, scan resume condition.

A functions: pager and code squelch (compatible w/ other iCOM radios, looks like a nice feature!), DTMF (16 memories, 15 digits each).
P functions: memory channel watch, memory scan watch.

In answer to KE8GW, yes, you can use DTMF, actually I like it better w/o the keypad (it's pretty simple to dial too), you can use 0-9 and A-F (what E and F are, I don't know, possibly # and * ?)

Operating Period:

Batt Pack Out Volts Operate Period

BP-121 7.2V 3h 40 m
BP-122 7.2V 6h 20 m
BP-123 7.2V 11 h
BP-124 12.0V 2h 40 m

conditions: TXing at high power for 1 min., RXing for 1 min. and standby (power saved) for 8 min.

Specifications:

GENERAL

144-148Mhz (Tx) 140.000-150.000Mhz (Actual Tx)
138-174Mhz (Rx)

100 Memory channels (0-9 can store all info, 10-99 general info)
2 scan edge channels (PA, PB)

External DC power supply 6 - 16V DC (negative ground)

Current drain @ 13.8V typical: TX (High 1.4A / Low1 100mA)
RX (Rated audio output 150mA / Power saved 16mA (average))

Frequency stability +/- 10 ppm

Dimensions:

w/ BP-120 320 g; 11.3 oz (varies depending on the battery type)

TRANSMITTER

Modulation system : Variable reactance frequency modulation

Spurious emissions : High (Less than -60 dB)
Low1 (Less than -40 dB)
Max. frequeny deviation : +/- 5.0 kHz

Microphone impendance : 2 k ohms

RECEIVER

Rreceive system : Double-conversion superheterodyne

Intermediate frequencies : 1st (30.85 MHz) 2nd (455 kHz)

Sensitivity : Less than 0.18uV for 12dB SINAD

Selectivity : More than 15 kHz / -6dB
Less than 30 kHz / -60dB
Squelch sensitivity : Less than 0.16uV at threshold

Spurious response rejection ratio : More than 60dB

Audio output power (at 13.8V) : More than 200mW a 10%
distortion with an 8 ohm load
Audio output impendance : 8 ohms

Ok, that should about do it, if you need anymore details,
email me, or if you have the mods for it, email those too <G>.
Also, I plan on getting the 4iA if money permits, so mods on
that one too would be apprieciated.

3648. Alinco DR130 Mobile 2m Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-18 03:30:11 UTC
From: rafaels@zimmer.CSUFresno.EDU
Message-ID: <CupoEC.1v7@zimmer.CSUFresno.EDU>
Source record: 224919

Help! I just purchased a new Alinco DR130 and before I send it for repair I want to know if the problems I have are common to this radio.

1) The speaker "rings" with certain voices. The ringing disappears if I hold the radio (usually near the speaker).

2) The squelch does not get rid of distant signals (repeaters or simplex). Turning the squelch all the way up (or down) does not get rid of thoes weak stations.

Thanks for the feedback.

73 de Rafael, KE6JSR

>enough people ask for it, they will include all the functions in
>future instruction manuals.)

Note that these "extra features" come with the caveat that Kenwood doesn't officially support them--it's caveat emptor.

We bought three '733A's for the ham club here at work, and I've tried the clone function. Bad news: while the memories seem to clone okay, the process causes both the master and slave radios' VFO modes to go into outer space--like instead of being limited to tuning the VHF side to below 180 MHz, the VFO can only tune *above* 180 MHz--not too useful when I'm trying to dial in 2M frequencies.

I tried two or three times to clone a "good" radio to a slave, and ended up with the same ill-effects--which required a master reset to recover from.

I just got my license in France and I want to purchase a mobile
transceiver for VHF & UHF.

Notice that I've already the antenna : a SAGAN bi-Band magnetic mount 50cm.

What transceiver with the best quality/price ratio can I buy ?

For the moment, I ask self a question : Kenwood TM702 or TM732 ?

I hope your help !

>I hold the radio (usually near the speaker).

This is not uncommon with many radios. Just open it up and put a dab
of RTV in the right spot, should be obvious when you open it, to dampen
the case vibrations.

>2) The squelch does not get rid of distant signals (repeaters or
>simplex). Turning the squelch all the way up (or down) does not get

This is normal if the stations aren't quite noisy. The squelch is a
noise squelch, not a signal strength squelch like on CBs, and if the
signal is full quieting, there's no noise, hence the squelch opens.
If you can't squelch noisy signals, then there's a real problem.

|>

That's not real surprising. A lot of the older radios cann't handle the
12.5 KHz step. That's why I've switched to a Yeasu FT-11R.

What really surprised me one day was when I found a brand new radio that
wouldn't accept a separate transmit frequency and would only handle the
offset in 50 KHz steps. Kind of hard to deal with the new repeater pair
(148.125 output/143.750 input/4.375 offset).

For the price the Radio Shack DSP is good. Don't believe the documentation about the "Noise reduction," it has no noise filter in it. Other than that the price is right at $80.

Source record: 224938
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

-=-=-=

I expected a type "N" connector, the radio came with UHF.

Control wart: (are you listening Yaesu?) You can only transmit on the "main" (ie. left) side of the radio. When both 2m and 70cm receive are active, you change bands with the "BAND" button. This swaps the left and right displays. When dual in-band receive is active, the "BAND" button changes both the main and sub receivers from 2m to 440 or from 440 to 2m. Arrrgh!!!! I would prefer a "SWAP" button to swap left and right regardless of mode. (The "SUB" button is used instead.)

Automatic backlight dim: works as advertised but the backlight level under low ambient lighting is WAY too low. Manual control is the best solution.

DTMF page: works as advertized, but the *&%$#@ thing insists on "ringing" like a phone EVERY time it receives the page sequence. This means that you have to co-ordinate with the other station to turn the *&%$#@ DTMF stuff off at the same time or tolerate the "ring" at the start of every receive.

CTCSS decode: squelch opens quickly when normal CTCSS decode (an option) is enabled. There is a CTCSS page function that has a distinct delay between receipt of carrier with CTCSS and open squelch. I don't yet understand the use of this "feature."

There is no SCAN button on the front panel. Scan is initiated by holding the up or down button of the mike down for two seconds. The scan is blindingly fast when compared to the Alinco 590 that I used to have.

Memory: memory is divided into four "banks." Two for VHF, two for UHF. Only one bank can be active for each receiver. I consider this an advantage, but you may not. There are two obvious (to me) uses for this configuration. First, you can store frequencies for different uses in different banks. Second, you can activate one 2m(440) bank in the main receiver and one the other 2m(440) bank in the other receiver and scan them simultaneously.

Heat management: After seeing the HUGE heat sink on the back of the Alinco 590, the Yaesu 5100's sink seems too small. In a key down experiment, the heat sink of the Yaesu got almost too hot to touch before the fan kicked on. If I were planning to run a packet station, I would definitely look into some extra forced air over the back of this one. As it is, I'm a bit concerned about how hot it will get mounted in my dashboard. [Others people don't seem to have this problem.]

DTMF Decode and Scan: If you have CTCSS decode (an option) enabled on a memory and you are scanning and there is activity on that frequency but without the correct CTCSS tone, the 5100 stops scan, flashes the strength meter and then continues

scanning. It is slower than normal scan, but still quite
fast.

-=-

Wireless Mike (review):

The wireless mike sends audio over 49.85MHz, so it is can't be used in high RF environments (like near computers). It duplicates ALL front panel controls with the exception of the power button.

It interfaces to the rig via a standard mic plug. The receiving unit is only about 1'h x 2w x 1/2d.

[ed] The implications of this are that the entire radio can be controlled via the microphone port! Too bad there isn't a fancy *wired* mike with all the controls on it.

Several people have reported trouble with the mike -- enough trouble for them to return it because of poor range and poor audio. It works well if you sit on top of the pickup unit, but then you don't need a wireless mike.

Attributed: Tony Pelliccio, KD1NR system@garlic.sbs.com

-=-

Backlight Control (both):

Effect: manual control of backlight

1) Hold down the MHZ key and turn radio on
2) Use tuning knob to adjust brightness
3) When FUNC is active, the tuning knob will adjust brightness again.
4) You can restore automatic control by repeating step 1.

Notes: Manual is fuzzy on this feature.

Attributed: Yaesu

-=-

Crossband Repeat (reported as working on 5100 and 5200):

Effect: Enable crossband repeat

[ed -- Note that there is a 5200 specific crossband mod that appears later in this list -- I don't own a 5200, so I can't test either. This key sequence works on my 5100.]

1) Dial up two frequencies you want to crosslink (be sure to pay attention to transmit offsets, if any)

2) Turn radio off.
3) Hold down the RPT key and turn radio on

Result: The tone encode/decode flags and the -+ flags will be flashing and the radio will be in low power mode. When either band's squelch opens, the other band is moved into the primary frequency display and the transmitter keys. Audio link appears to be speaker to mike.

Exit crossband repeat mode by repeating steps 2 and 3 above.

Attributed: Yaesu

-=-

Crossband Audio Enhancement (both):

Effect: unmuffle crossband audio

Connect a 27K ohm resistor between the audio-in and audio-out leads on the data jack (inside the shell of a mini plug, that is). The mic element stays live while in crossband operation. It is a good idea to remove the mic from the rig while cross banding if you need/want to eliminate ambient audio.

[ed note: This mod was for the "old" style data jack. I don't know what the effect will be on the "new" style data jack.]

Attributed: Bill Mayhew, N8WED, wtm@uhura.neoucom.edu

-=-

Transmitter Timeout (both):

Effect: automatically limit transmitter "on" time

1) Hold down the HIGH/LOW button and turn radio on
2) Use tuning knob to change the number in left VFO. This number is number of minutes for the timeout timer. The factory default appears to be 15 minutes.
3) Transmitter shuts off with "Err" displayed in VFO if the time limit is exceeded.

Attributed: Bill Mayhew, N8WED, wtm@uhura.neoucom.edu

-=-

DTMF decoding (neither): :-(

Effect: display decoded DTMF tones

Ed Note: this works on the FT-530, but not on the 5100. I'm including it here on the chance that it works on the 5200. Please try it on your 5200 (or 5100) and tell me if it works for you.

1) Select frequency and turn on the code squelch
2) Press Function-Page(Code) to select a code memory
3) Dial up to memory #7 [the 5100 won't do this]
4) Watch the dtmf's scroll by as they are heard by the radio!

Attributed: jmeyers@ecst.csuchico.edu (Jeff Meyers)

-=-

The "P" Key on the microphone (both):

I was curious about that "P" key on my FT-5100, so I called Yaesu and they explained the situation. They designed the the mic to accommodate "future products". The "P" key is there to be taken advantage of at a later date by other models. They just did not want to re-design the mic again within a short period of time.

Attributed: Will Collier, KB5WRK, COLLIER@gallant.apple.com

-=-

Tech Manual (both?):

The technical manual for the 5100 is [information wise] pretty spare. No additional operating notes or hidden secrets are revealed. It is worthwhile for the alignment notes and complete parts list. Call the number in your owners manual to order.

Attributed: Bill Mayhew, N8WED, wtm@uhura.neoucom.edu

-=-

Wireless Mike Problem & Fix (both):

Effect: Unexpected/Undesired Transmission

The wireless mike will pick up any transmission in the 49MHz range (including cordless phones and baby monitors) and re-transmit them on the ham bands. Don't leave your radio on and unattended with this option installed.

Attributed: kenh@w8hd.org (Ken Hoehn)

The Fix:

There's a modification for the MW-1 that will only let the radio key up when it receives both the 49MHz signal and an infrared command from the MW-1 remote. I think they list it in the users manual for the MW-1. [ed. with this enabled, some have complained that the transmit is intermittent.]

Attributed: system@garlic.sbs.com (Tony Pelliccio)

-=-

Band Limit Scan (both):

Effect: use one or both band limits

By marking one of the L, U, 1L, 1U memories as "skipped," the
limited band scan will only use the other pair of band limits.

Attributed: Brian McMinn, N5PSS, brian.mcminn@amd.com

-=-=-=

9) Turn on the radio. Radio will now show 300.000 & 20.000 on
display.

NOTE You can re-enter band edges any time after this by
pressing and holding [D/MR] [F/W] [REV] keys while
turning the radio on. Unfortunately, this operation
clears all of the memories.

10) Set UHF Rx Low - Press [MHz] and dial 420.00, press [D/MR]
11) Set UHF Rx High- Press [MHz] and dial 475.00, press [D/MR]
12) Set UHF Tx Low - Press [MHz] and dial 420.00, press [D/MR]
13) Set UHF Tx High- Press [MHz] and dial 450.00, press [D/MR]
14) Set VHF Rx Low - Press [MHz] and dial 128.00, press [D/MR]
15) Set VHF Rx High- Press [MHz] and dial 180.00, press [D/MR]
16) Set VHF Tx Low - Press [MHz] and dial 140.00, press [D/MR]
17) Set VHF Tx High- Press [MHz] and dial 150.00, press [D/MR]

NOTE magical Rx/Tx band edge setting mode ends here,
remainder goes as stated in manual. Repeater offsets
and tuning steps vary by state/country so following
numbers are not "fixed".

18) Set UHF offset - Press [F/W] then [RPT] dial 5.000 press [RPT]
19) Set UHF tuning - Press [F/W] then [REV] dial 25.0 press [REV]
20) Change band to VHF - Press [BAND]
21) Set VHF offset - Press [F/W] then [RPT] dial 0.600 press [RPT]
22) Set VHF tuning - Press [F/W] then [REV] dial 20.0 press [REV]
(VHF tuning step varies by state -- many use 15.0)

Diagram: [there are no tabs in this section - ed]

Ok, here's where it gets tricky, but so you know, a '|'
represents a jumper.

Band Switching or Tone Burst via D/MR button on microphone (5100):

Effect: D/MR button on microphone performs band switching or
1750 Hz tone burst rather than D/MR function.

NOTE Since there is only one [D/MR] button on the mike, it
is of course impossible to get both of these functions
at same time. Make your choice.

For band switching:

1-5) as in above mod
6) Remove the jumper on Pad R4067
7) skip above step 7
8) continue with step 8 above

For tone burst:

1-5) as in above mod
6) Add the jumper or 0 Ohm resistor on Pad R4065
7) skip above step 7
8) continue with step 8 above

Remote Control Mike Interface (5100, maybe 5200):

Effect: remote (wired) control of radio

The Remote Control Mike (from Yaesu) uses a serial data stream
interface in the microphone jack to control the 5100. This
simple hardware interface allows a computer to control the
5100 in the same way. It is somewhat similar to the CAT
interface I have built for my FT-757 HF rig, but mostly like
the interface described in the FT-912R manual (loaned to me
via a friend from Yaesu). When using my PC as the source for

the serial data, I used a MAX232 chip for a level conversion between the +/- 12 volts levels on the computer and the 0-5 volt levels on the radio.

The serial data parameters are 4800 N82. The commands sent to the radio are simple one byte instructions. The RMC mode ON command (16) must be sent before any other command. When the RMC mode is ON, a small LCD "RMC" icon will light on the display (see owners manual under Display). Also, the Vol, Sql, and Bal knobs are disabled when in the RMC mode because they will be controlled via serial commands, but all other buttons are still active.

The commands are as follows:

0 - RPT 12 - CALL 24 - SQL Up
2 - REV 14 - BAND 26 - VOL Up
4 - MHZ 16 - RMC 28 - BAL Right
6 - D/MR 18 - SUB 30 - BAL Left
8 - TONE 20 - PAGE 32 - SQL Down
10 - LOW 22 - F/W 33 - VOL Down

The interface I built simply wired mike port pin 7 to serial ground and pins 1 and 3 each through a diode then together, to the serial source. Note: I am not a hardware person! Use this hardware at your own risk.

```
+----1 7------------- GND
| 2 8 6 (These can be connected to a MAX232
| +--3 5 +-+-------- SER IN or the FIF-232C pins 1 and 3)
| | 4 | |
| +--->|---+ |
+----->|-----+
```

You can wire 1 and 3 together first, then through 1 diode, but that disables the UP and DOWN buttons.

I'll continue to study this more. If anyone would like to know more, or has any corrections or feedback, please email me.

-=-

Dual 2m receive oddity (5100 only):

Effect: Receive's 2m frequency in wrong place

When in dual receive mode with two 2 meter frequencies displayed, the 5100 will receive a strong 2m signal at both the correct frequency (f) and at (292MHz - f). For example, the 146.78 repeater will be heard at 145.22MHz. This "image" can be received on both the main and the sub band tuner. If

both the true and the image frequencies are tuned at the same time, they will interfere with each other (ie. they are very close to 180 degrees out of phase).

Attributed: Brian McMinn, N5PSS, brian.mcminn@amd.com

-=-

Fan Control (5100 only):

I have the service manual for the FT-5100. There doesn't seem to be any trimmer pot that can be set to change the fan's trip point. In fact, the wiring diagrams don't seem to even show the fan. The 144 MHz PA board has a thermal cut-out switch that feeds back to the PROT line on the main board. That doesn't seem to be related to the fan operation, but rather to shut the transmitter down for massive error conditions.

I'd have to take my 5100 apart, but from the implication of the service book, it looks like the temperature sensor might be integral to the fan itself.

Attributed: Bill Mayhew, N8WED, wtm@uhura.neoucom.edu

-=-

Data Port Model Update (5100 only?):

In late 1993 or early 1994, Yaesu re-designed the data port on the 5100 to conform to the newly released Japanese radio maker's "standard" for direct 9600 baud connection. One of the prices for going to 9600 baud is a change in pre/de emphasis technique. Although the changed pre/de emphasis made the data port work at 9600 baud, it no longer works at 1200 baud.

On an "old" (pre 1994) 5100, 1200 baud works fine via the data port and 9600 baud is impossible.

On a "new" (1994 and later) 5100, 9600 baud works fine via the data port and 1200 baud can only be done by wiring through the microphone port (where TX and RX audio is available).

Band Switching or Tone Burst via D/MR button on microphone (5200):

Effect: change function of D/MR button on mike.

This is based on information from Yaesu in Japan.

The functions of pin 5 (the microphone button) can be altered
by changing jumpers in the control head. To find these
jumpers, see the section on packet radio in the ordinary
instruction book.

Control Head Jumper No
Pin 5 Function Closed Jumper Marked By X
1 2 3 4 5
D/MR X
Band X
1750Hz Tone Burst X X
Main band Busy Out X
Sub band Busy Out X
Call Channel X X

Main / Sub band busy out - When open SQL = 5 Volt DC
Closed SQL = 0 Volt DC
[ed - I'm not sure what this means since I don't own a 5200]

Attributed: John Newgas, G7LTQ jnewgas@cix.compulink.co.uk,
g7ltq@g7ltq.ampr.org

-=-=-=

screws). For convenience, remove the speaker, noting which way the two pin pcb connector is oriented. [ed -- does it matter?]
4) Remove two side screws holding on the front of the chassis and remove chassis front. (The chassis front is the surface with the contacts for the control head.)
5) Locate a double row of ten by two jumper spots, numbered 1 to 20. The jumper configurations will depend on the area for which the rig was intended. Note the arrangement if you ever want to un-modify your radio.
6) Using a fine-tip soldering iron, set the jumper spots as follows:

1 closed
2 closed
3 closed
4 open
5 closed (G7LTQ says open here...)
6 closed
7 closed

These jumpers are located in the main radio case. For location, refer to the FT5200 Technical Guide. [ed -- looks like the Tech Guide calls them JP5001 to JP5007]
7) This completes the alteration for frequency expansion. Reassemble the radio.
8) Reinitialize the radio by turning it on while holding [D/MR], [F/W], and [REV].

NOTE There are several different versions of step 9 and I don't know which is most correct. -- ed

9a) (from Hugo Cornwall) You must now program in the band limits. The display will show a blinking "1" in the left-hand memory box and "000.000" in the left-hand frequency display. (Ignore the right-hand display for now). The following limits are suggested, but the RF circuitry of the rig will only cover slightly less. Use the dial or up/down buttons to select the frequency and then press [D/MR] to store it. The blinking "1" will increment.
VHF rx: 137.000 174.000
VHF tx: 137.000 174.000
(display will show blinking "1" and "300.000")
UHF rx: 410.000 470.000
UHF tx: 410.000 470.000
(Note: it is possible to set the RX limits wider than the TX limits; for obvious reasons you cannot have the reverse situation).

9b) (from Stu Kroner, N1JEF)
Select VHF range
select 118.00 Mhz press [D/MR] (VHF rx low limit)

select 174.00 Mhz press [D/MR] (VHF rx high limit)
select 140.00 Mhz press [D/MR] (VHF tx low limit)
select 150.00 Mhz press [D/MR] (VHF tx high limit)
Select UHF range
select 420.00 Mhz press [D/MR] (UHF rx low limit)
select 475.00 Mhz press [D/MR] (UHF rx high limit)
select 420.00 Mhz press [D/MR] (UHF tx low limit)
select 450.00 Mhz press [D/MR] (UHF tx high limit)

9c) (from John Newgas, G7LTQ)
Program in VHF low edge of Rx
VHF high edge of Rx
VHF low edge of Tx
VHF high edge of Tx
Repeat for UHF in the same order.

10) You can repeat the power-on-reset sequence above at any time if you need to change the limits.
11) The pre-set repeater offsets are now no longer available and you will have to set them up manually using the instructions on page 16 of the manual. The Automatic Repeater Shift (ARS) feature (also on page 16 of the manual) will also have disappeared and you will have no way of getting it back (except by changing the jumpers back).

Attributed: Hugo Cornwall
John Newgas, G7LTG jnewgas@cix.compulink.co.uk
Stu Kroner, N1JEF, skroner@mitre.org

-=-

Cross Band Repeater (5200)

Effect: enable crossband repeat

[ed - this is a continuation of the above]

1) You can enable the crossband repeater without altering the frequency coverage. The only hardware alteration is the removal of the link at jumper spot 17. (Note, just below jumper spot 17 is a separate jumper spot, not part of the group of twenty - leave this alone).
2) To enable, turn on rig while holding down [RPT] button. The rig is now a crossband repeater - you will get confirmation of this from the display: the 100s position on the two frequency displays will be replaced by a "R".
3) While in cross-band repeater mode you can change the frequencies of each band.
4) The crossband repeater suffers from desense. It works better at low power and even better if you use an external diplexer and separate antennas. The more isolation between the two bands, the better. As with all cross-band repeaters, results will be poor if the UHF frequency is a

direct multiple of the VHF frequency. If you are planning
extended use of a crossband repeater, make extra sure that
the rig is adequately ventilated.

Attributed: Hugo Cornwall

-=-

Crossband Repeat (5200):

Effect: crossband repeater
Bad effect: CTCSS function is lost

[ed -- there is another crossband mod in this list...]

This is based on information from Yaesu in Japan.

These jumpers are located in the main radio case. For
location, refer to the FT5200 Technical Guide.

1) Remove (open) JP5017 on the interface unit
2) Press and hold PRI button while switching on the power.
3) The FT5200 will now work as a cross band repeater.
4) The CTCSS function will be lost.

>Is there software out there to pick up ATV 94?

Yes. Well, actually it's a software/hardware package. It's called Pasokon TV.
It was developed by John Langner WB2OSZ. I think his company name is
"Absolute Value Systems" in Chelmsford MA. Then again, Amigas are real cheap
these days so you could run the "real" AVT package from AEA.

Here is a loaded
question, but if you were to buy a new TNC to-day (given all that on air
experience that you have gained since) which manufacturer and model would
you get? I am looking for the best combination of price and
performance.

Thanks in advance

3670. IC765 Keyer Mod?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-18 20:03:16 UTC
From: tconboy@uswnvg.com
Message-ID: <33599@uswnvg.uswnvg.com>
Source record: 224942

Is there a simple mod to convert the internal CW keyer in an IC765 to eliminate the "trailing dot problem"? I think this is the difference between the Curtis Type A and Type B keyers.

I'm using an external keyer since I can't tolerate the way it works now when using a dual lever paddle in the "iambic" mode.

73, Terry

>Has anyone measured the amp-hour capacity of typical D or AA alkaline
>batteries? Also, ->Snip<-

Gary:

As someone already stated, the Ah rating of Alkalines is a bit elusive since their ratings are based on discharge levels different from nickel-cadmium and Gel-Cells. The last information I saw from Duracell indicated that AA cells were rated at 2.4Ah and D cells at 14Ah. Remember again that to get all of the energy from Alkaline cells, you discharge them to about .7 V per cell (again, depending on the discharge rate). I have not experienced any problems with alkalines in HT's, although there may be some reduced output due to the voltage depression during high power transmit. Maximum current output of Alkaline cells is usually a bit less than 2 times their rated capacity. You will have depressed voltages at this rate and some self heating.

For emergency use, you can't beat Alkaline cells for adaptability, availability, energy density and shelf life. In daily routine use, they can cost you a fortune compared to rechargeables.

I have some discharge curves on Duracell cells and will drop then in the mail if you wish. Drop me a note with your address.

Ken Jeffcoat

Ref.: Dual band Base/Mobile radio

Hi.
I am looking for a dual band base or mobile radio (2m & 70cm).
Mostly, I would like to use it for packet and phone patch operations.
What is the best buy (new or used)?
I will appreciate if you can share your knowledge and experience with
me.

3678. TENTEC SCOUT Power Supply Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-18 23:17:08 UTC
From: Robert Schnick <qrp@delphi.com>
Message-ID: <5oyxtQU.qrp@delphi.com>
Source record: 224846

I recently bought a model 938 power supply from tentec for my Scout - they claimed that the 938, a switching power supply, would work with the rig. Problem: WHen I key down all of the 50watts, the power supply can't deliver the adequate, er . . . power. The rig works fine on my old Pryamid 10 amp supply. I've gotten 2 938s from TenTec and they both perform similiarly.

What am I missing? SWR is fine - my station has been annoying the neighbors for the last ten months with great results (actually, the neighbors don't know I exist) I have used the antennas with my QRP equipment with great (That's a qualified great in light of the sunspot cycle).

I like the scout - 50 watts is more than enough kick for these days of lesser propagation . . .

Any Ideas?

I have an ICOM IC-211 multimode base station. It is not fancy but it works well for me. Did Icom ever make a 440 version of the radio? The IC-411 maybe? Or was IC-451 their first multimode 440 solid state base rig?

Steve Fluegel (steveflu@microsoft.com) wrote:
: I'm trying to decide which mobile dualbander to buy. Two that
: I'm considering are the Yaesu FT-5100 and FT-5200.

Have both.

: I'd like to hear people's comments - what you like, what you
: don't like, usability, audio quality on xmt and recv,
: intermod performance, bugs, etc.

I like the 5200 remote head. Allows it to be sticky back velcroed on my Ranger dash above the am/fm. Nice to be able to play with buttons without having to take my eyes completely off the road. 5100 has more memory channels but the number on the 5200 is adequate for *my* needs. 5200 does cost more and the biggest practical (IMHO) difference is the remote head. The 5100 is the better value.

: Also, I have some questions:

: 1) I believe both of these have a data jack on the back -
: correct? Does it support 9600bps?

Supposed to support 9600, haven't tried it. Have tried it with a kpc-3. Didn't work without having to finally call kantronics and modding the kpc-3. Clipped a resistor to increase the output impedance. Had to set the output much higher than factory to get correct deviation. This is all with the data jack, haven't tried going from the front mic connection. One of the reasons I bought it was to be able to packet with the mike still connected.

: 2) Can these be remotely controlled via DTMF? (Yes, I am
: aware of the legal issues involved.)

Don't think so.

: 3) Are there any differences between these two other than
: the 5200 having dual in-band receive and 32 memories and
: the 5100 offering remote mounting and 94 memories? Do they
: take all of the same accessories?

As far as I know, they take all of the same accessories. Internal mods are different.

: Repond by posting or feel free to email me directly at
: steveflu@microsoft.com.

: Thanks,
: Steve (Tech+ callsign on the way!)

Hope this helps. I like them both although the 5200 is the one I use most.

I have a TVI problem that is not like anything I have ever seen in many years as a ham. The TV in question is a small screen Emerson. Whenever I transmit on the HF bands, the picture color turns orange. There is no problem with the sound or sync. The problem is particularily severe when transmitting on 20 meters. It makes no difference what TV station is being tuned in, VHF or UHF. Another TV set on the same antenna has no problem. The same situation exists with a VCR feeding both TV's!

I can conclude that the problem is not caused by harmonics or other problems generated by the transmitter. It would appear that the signal is not coming in on the antenna lead at all. I tried wrapping the power cord around a ferrite rod, but that didn't help either.

Has anyone had a similiar problem? Does anyone know how to contact the manufacturer?

Thanks,

Paul AA6PZ

I just sent my trusty Icom u2AT back to the factory, after it was dropped for the first time and actually harmed in six years. (It has a plastic case and just seems delicate). Anyhow I sent it to the factory center in Bellevue for a complete re-hab. I had them change the CPU battery, battery slide and keypad while they were at it. They did a good job, and I'm happy.

My first radio too! I love it..

> 1. Since I had the mods done I can transmit in frequencies I'm not
> supposed to transmit in (e.g. Police frequencies). Is there any way
> I can turn transmit off on those frequencies alone? I've tried to do
> this by storing the PTT disable in the memory along with the
> frequency but it does not seem to be a setting that is set
> separately for each memory.

I did the other R15 mod that makes it out-of-band *receive* only.
This was after I once dropped the radio and saw it key up briefly on
top of NOAA weather. Out-of-band Tx is too much responsibility,
especially when you're still learning the ropes of the radio and the
permitted bands. Also consider the risk of loss or theft of the radio
to someone less scrupulous..

> 2. I'm concerned about how quickly the battery runs down.

I wouldn't worry too much about. Too many HT users get all obsessed
with battery life and optimal usage habits. The truth is that if you
use the radio normally, and recharge the battery with a smart charger
when it gets low, there isn't much more you can do to extend either
its capacity or useful life. Whether you wait until the display
blinks or just charge it when you feel like it really won't make much
difference at all.

The only common damaging things I've seen are: gross
overcharging/overheating (usually by "Quick Chargers" with no smarts),
or dissipating entire series-connected packs to 0 volts using
resistors or bulbs. The radio will keep you from going below ~5v,
which is plenty fine for a 7.2v pack. A 12v pack should be charged
sooner, especially if you're transmitting.

> 3. I'm using all the battery saving functions and I'm wondering if
> they really do make a difference.

They do! I've watched the current draw from ther radio both with and
without the Rx saver, and the difference is significant.

I usually use the "ABS" setting, which polls the signal less and less
frequently as it remains inactive. If the frequency has been quiet

for a long time, I usually miss the first few syllables, but the battery lasts much, much longer.

I don't use the Tx saver, because in fringe areas it drops the repeater between words when it turns down the output power. Also, it uses the received signal strength to determine the transmit power. This isn't a good metric, since I often receive repeaters very well while I can't reach them.

> 4. Are there any cheap alternatives to buying Yaesu
> batteries/chargers for the FT-530?

Yes. Both Periphix and W&W Associates make 7.2v and 12v batteries for the radio for less $$$ than Yaesu.

I bought a 12v 800mah ($49) from W&W with their Master Charger I ($89), and I'm very pleased with both. The charger is a smart Delta-V charger based on the Philips TEA1100 charger IC. They're in New York at 1-800-221-0732. If I had it to do over again, I'd get the 7.2v 1500mah for $49 instead of the 12v.

I haven't bought from Periphix since their prices are a little higher, and they don't make their own charger. I think they resell Yaseu's, so the price is high.

> 5. What kind of antenna can I replace the standard one with to
> improve my transmit (instead of increasing wattage)?

I haven't tried any others, but I hear the AEA Hot-Rod works well. Ask around and maybe borrow a friend's to try it.

Enjoy!

I have a 10+ year old Santec ST-142 2m HT. It still works pretty well. I bought it back when I was in the Civil Air Patrol, before I got my ham license. I have a subaudible tone board in it, made by "Communications Specialists", I think. It is programmed by burning the codes for the tones into a chip of some sort, possibly a ROM. I've still got the programming board, which used a 12V power source.

Unfortunately, the tones programmed into it don't match any of the local 2m repeaters. The chip itself is marked M1-0198-S, and has an "H" logo in front of the number (Harris?). Does anybody know if that chip is still available? Does anyone perhaps have the single page of programming instructions for this board? Does anyone make another tone board for this make and model of HT? Thanks.

Hello, I have a Rohn HBX32 tower for sale. This is a 32' self-supporting steel tower. It is in excellent condition and includes all hardware, except for base stubs. It comes in 4, 8 ft sections, which can be stacked inside one another for easy moving/storage. It is rated for a 10 sq.ft. antenna windload @ 70mph winds.

$175, or best offer. (Texas Towers sells them locally for $275)

Please email to 'debaker@bnr.ca' or call 214-684-7351 (day)

Hmmm. Try putting a dummy load on the back of the Scout and see if
full power is delivered that way. If so, it may mean that some RF
is creeping into the supply and upsetting its innards. Check your
grounding arrangement if so. Might even be worth while verifying
the polarity and such of your 120V outlet (if you don't have one of
those three-light testers, get one... ...it will save your life one day).

Otherwise, if it has happened with two supplies, and it happens on a
dummy load, it may be that your Scout is slightly out of adjustment
and is actually not as efficient in the final as it ought to be. The
Pyramid supply might be less sensitive to the overload that would
result.

It is almost certainly less sensitive to stray RF than a switcher.

TenTec are helpful folks. Call them and talk.

Greg

3695. Power Source for HT in Wilderness??

Subject: Power Source for HT in Wilderness??
Organization: LOSAT Project Office
X-Newsreader: WinVN 0.92.1

I am going on a fishing trip to Canada (Central Ontario) and I would like
to take my HT with me. The ARRL repeater guide shows a repeater not
too far from our location. Problem is this: We have no source of power
in the cabin where we will be staying, other than solar. Does anybody
have any experience with or recommendations for a solar battery charger
that could be used in conjunction with my Kenwood TH78A? I can either
charge the standard large Kenwood battery (12VDC) or invest in the
Kenwood battery carrier pack that allows use of standard NiCd AA
batteries off the shelf and charge either from solar.

Any suggestions or recommendations?

Icom's radio after the IC-211 was the 251 (two meter, all mode).
They also made the 551 (six meter, all mode) and 451 (3/4 meter, all mode)
rigs similar in appearance to the 251.
Also, Icom made the IC202S (two meters), the IC 502 (six meters), and the
IC 402 (440 mhz) rigs. All about two watts or so, SSB and CW, but NO FM.
I just sold my 202S ... it was a good radio but my IC 251A is better for
me. Then there were the mobile all-mode rigs ...

Hello,

I have a MACO Quad Antenna 10-15-20 meter and have misplaced my
assembly instructions.

Would anyone have a copy or know the name of the company that produced them?
(I seem to recall Springfield, Illinois somewhere in the instructions).

email would be cool
thanks
travis

|> GA.)

Well John, I may be putting my foot in it on this one....

I THINK we are required to have DESIGNATED repeaters in the area dual toned.
Secondary would not be required.

Example: We have a repeater in Portland that is heard from Olympia,
Washington to Eugene, Oregon. We have another repeater 30 miles east
of Portland on Mt. Hood (actually on Tom, Dick, and Harry (yes that's
the mountain's real name)). Both repeaters are on the 148.150 pair.
Both are accessable from the Portland area. (I've actually keyed up
the Mt. Hood repeater with a handheld from my front yard 20 miles west
of Portland.) If both repeaters were dual toned, we would have a big mess.

: My question is this: What temperature is equivalent to a 15W "low
: power" soldering iron (yeah, the blue one from Radio Shack)?

You typically want to set your iron to 700 to 750 degrees for soldering.

There is no temperature to power equivalence, as you can adjust the
temperature on an inexpensive iron over quite a range by leaving it
plugged in for a variable amount of time.

If it wasn't plugged in long enough, it wouldn't melt solder.

If it was plugged in too long, it would get hot enough to
lift traces off the board (800 to 850 degrees). A skilled
solderer would learn how fast to work to keep the soldering
iron at the proper temperature. The clueless newbie blamed
the board manufacturer for the cheap circuit board material.

To all you fellow Kenwood TH-79 owners:
I came across this posting from chip33@aol.com on the America Online - Ham radio club message section:
==========Start

==========
Subj: TH-79 Mods 94-08-16 09:29:13 EDT
From: CHIP33

I just got a 79 and its a great little radio.
MY question is does any one know what the KEYPAD mod is that opened this radio up to TX on ANY freq that is displayed on the lcd screen?
A guy at the hamfest took the radio did a bunch of key pushing and VOILA this radio TX's on any freq it RX's on. Would really love to know what he did. Said he "used" to work for a Kenwood repair station and "knew" all kind of interesting things. He WOULD not show me what he did or tell me how I could contact him. The mod is permenant. I did a complete reset and it stayed intact! I really like it. it even added in he menu section a selectable AM/FM page too.
========== END ==========
Unbeleivable yes/no
Hmmmmmm ??????!!!!!!!!!!! Interesting. First one to figure this out gets into the radio mods Hall of Fame.

3706. Kenwood TM-241A problems in Chevy S10 pickup

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-19 20:51:33 UTC
From: rule@cdpa.state.ms.US
Message-ID: <24114.rule@cdpa.state.ms.us_POPMail.PC_3.2.3_Beta_2>
Source record: 224876

When I transmit on my Kenwood TM-241A 2m radio on high power, it causes the windshield wipers to activate. This only happens when the Chevy S10 pickup is running and moving. It doesn't happen when the truck sits idle or when the engine is turned off. This problem doesn't seem to happen on mid or low power. When I turn on the turn indicator, it disrupts the receive when the radio is set to any power setting. Also, if I am transmitting on any power setting and turn on the turn indicator, the windshield wiper activates.
The radio is mounted on a hump mount with the mount itself grounded to the cab of the truck. The positive and negative leads of the power cord are connected directly to the battery. The antenna is a Kenwood MA-700 mounted with a trunk lip mount on the driver's side of the hood. The coax runs across the top of the fire wall to a grommet on the passenger's side.
Has anyone else experienced this problem? Any ideas will be appreciated.
Thanks.

You didn't say how long you will be going, or how many hours of radio you expect. Alkaline batteries hold more charge than NiCd's, and they don't self-discharge when not in use. That might be an alternative until you have tme to investigate solar cells.

>what type of software and cable is needed to program the frequencies into
>this radio. I also need to know where I can get the software and cable.
>Any help would be appreciated.

I'm looking for the same thing.

What I know: Fujitsu Ten made a small programmer that was used to
program a chip in the radio. They did not like to sell these to anyone
but dealers. I have heard of other ways to program these radios, but
all of the leads I've followed have not actually found such a unit.

Fujitsu Ten no longer sells radios in the US, but still has a parts
and service operation in the Northern L.A. area. Calls to them about
programming info or hardware were not very useful. I was referred to
a local service company that wants $50+ per radio to make changes.

I'm told these radios cannot be programmed for operation in the ham
bands. This might just be a limitation built into the US version of
the programmer.

I'm also looking for a programming PROM for a VHF mobile from Fujitsu
Ten: model FTM15-3092H I do have a programming PROM for a UHF radio
of the same model, that I do not need.

3713. Kenwood TM-733 DTMF Confirmation Tone and PL noise bugs.

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-20 09:07:50 UTC
From: steve@vigra.com
Message-ID: <STEVE.94Aug20020750@susie.vigra.com>
Source record: 224892

To date, I have logged two trouble reports with Kenwood. I'm curious to know if anyone else has encountered these, and specifically if you have called Kenwood to report them.

The first is the well-known (but still denied) problem with the transmitted PL (CTCSS) tone. The tones are filthy. They contain many harmonics and synthesis noise. I'm guessing this is because they are using 7-bits from the CPU and a resistor net (DAC) to synthesize the tone. The sound/intensity of the noise depends on the actual frequency being generated. (The PL tones also come out of the radio's speaker while transmitting. Weird, but not a problem.)

The PL noise seems most messed up (on my radio) at 107.2 Hz, where the noise beats with the tone. Go simplex and ask someone to describe the noise to you, or listen carefully to your own speaker while transmitting. Some repeaters do a better job than others of hiding the noise for you.

Kenwood's response to this complaint seems to vary depending on who you talk to. One tech (I wish I would have got his name!) acknowledges the problem, and says they are working on a fix. He guessed that it involves changing a resistor. This would imply (to me), that they are simply turning the PL deviation (strength) down a bit to hide the noise. Unfortunately, this may make the PL less reliable for getting into repeaters. This is *not* an acceptable fix for me, so I'm insisting that they describe the modification to me before I send the radio in for repair. So far, no luck.

Other representatives will deny that they have heard of the problem. I don't know the cause of this, because it's a well-known and frequently discussed problem among local hams.

The Service Manual specifies a test for the PL. The technician is simply required to verify that any one PL tone is between 500 and 1500 Hz deviation. This is quite a wide tolerance range! The "standard" PL tone deviation should be 750 Hz. Twice that strong might be too strong and become audible. There are no trim-pots on the PL deviation, so I'm guessing that the deviation is pretty constant from radio to radio.

Has anyone measured their TM-733 PL deviation? I don't have the necessary test gear, but I would really like to know if they are actually running it strong, or if it's normal and noisy. I'll summarize any e-mail on this.

The other problem concerns the DTMF Confirmation Tones. This feature is off by default (I wonder why :), while it seems pretty useful. To turn it on, press [PTT] + [Down] on the microphone while powering the radio on. This will generate short DTMF confirmation tones whenever you send DTMF over the air from the keypad. Unfortunately, it mangles the beginning of the outgoing DTMF tone! This is serious enough that most local repeaters can't detect the tone, or count it as two tones.

Get a receiver and listen to what you are sending out when the Confirmation tones are enabled. It sounds to me like they may be mixing the confirmation tone in with the real tone and getting some destructive interference. Just a guess, though.

I called a Kenwood technician (Ricardo) and worked with him on the phone to reproduce the problem there. So, as of today, this is a Known Problem, and they are looking into a fix. :-)

I am really curious to know what they would say if other folks called up and complained about this problem. Would they deny hearing about it, or would it really be a Known Problem? Might give some insight into the PL-noise denial thing anyway. :-)

Personally, I'm much more concerned about the noisy PL than the DTMF confirmation tones, since I can just shut those off and pretend that feature doesn't exist. If enough people call about the PL problem, maybe they will come out with a real fix and offer it under warranty to all the radios out there (since they're all pretty new). My guess is that it will involve a free TSU-8 tone decode module, but don't hold your breath. :-)

Check your PL, and if it bothers you, call them! Their support number is: 1-310-639-7140, and you press [2] at their voice menu to get to the Amateur Radio department (8:30AM - 5:00PM PDT). So far, they have been fairly knowledgeable and responsive, and they always call back the same day if they're busy or stumped. I just wish they would offer a real fix.

Buy the battery carrier pack and take a bunch of alkaline cells with you.
Alkalines last much longer than Ni-Cads and, when they go dead, you just pop
them out and stuff in a new set. You can buy a big pile of alkalines for
the cost of a solar charger.

Or store the PL AND the frequency offset, but offset it in the
"wrong" direction. Then in an emergency, you just reverse the offset.
This method will work with rigs that won't store an "unenabled" PL.

3716. Recommended KAM Software

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-20 17:12:13 UTC
From: n6ng@crl.com
Message-ID: <335dhd$rfj@crl.crl.com>
Source record: 224893

I guess I need to put in my $.02 on this subject... I've been looking for
software for my KAM for quite a while and have tried a bunch. I tried the
KAGOLD testrun, PAKET 6, LAN-LINK and many others not worth mentioning (imo).
I settled on PAKET 6 as the best for my buck but LAN-LINK was a very close
second and I probably could have gone either way and been happy...

The disadvantage if any is that PAKET 6 doesn't support GTOR yet which I
think you said you wanted to do... Of course you can do all of it manually
but both PAKET 6 and LAN-LINK handle all the other modes well...
I have to admit that I'm fairly new operating with the KAM so there might
be some things I haven't figured out yet...

Anyway, now I have it off my chest... Please post any personnel replys as
I would be interested in other replies.

>kpc-3. Clipped a resistor to increase the output impedance. Had to set

Models of the 5100 produced, probably, within the last two years
have the data port on the back connected directly to the modulator.

I just fed my KPC-3 into the mic' connector -- no resistors needed
either -- just a straight connection.

>: 2) Can these be remotely controlled via DTMF? (Yes, I am
>: aware of the legal issues involved.)
>Don't think so.

5100 does have the wireless mike but it's on 49-MHz and can cause
baby monitors/cordless phones to broadcast on your rig! Apparently
there is a "fix" by using the IR LED option on the remote control
although I've read of problems with this.

>: 3) Are there any differences between these two other than
>: the 5200 having dual in-band receive and 32 memories and

>: take all of the same accessories?
>
>As far as I know, they take all of the same accessories. Internal mods
>are different.

Correction. 5100 has dual in-band receive. I believe it can be had
on the 5200 but not out of the box -- should require a mod.

Also, I don't believe that the DVS-3(?) (Digital Voice Synthesizer)
will work on the 5100. PLEASE!!! correct me if I'm wrong on this!

The only use of the term cloning I've heard with regard to any kind
of radio gear refers to the (very illegal!) practice of modifying a
cellular phone so it appears (to the cellular provider) to be a
different phone. The object, obviously, is to let someone make
cellular phone calls without paying for them. Supposedly, there's
quite a thriving business in NYC, especially among the drug trade,
in this stuff.

Larry asked about a problem with low hum injection in his radio.
I've had a similar problem with a Kenwood 733 and have traced it back
to excessive PL injection. Kenwood confirmed there was a problem with the
first batch and said they would fix it as soon as I sent it in.

Check to see if you disable CTCSS does the problem go away...
Just a thought.

Kenwood TH79 Dual Bander Modification and Feature Guide r1.0 8/21/94
==========

by Clayton Wagar, KD4IDN
920 West Crawford Street #7
Dalton, GA 30720

Here is a compiled list of modifications and features I've found for the Kenwood TH79 Dual Band HT.

Most of these are borrowed from other operators, to whom we all owe thanks for spreading information. I personally want everyone else to benefit from what I've learned.

This is release 1.0 of this document, dated August 21, 1994.

If you have any other comments, mods, or information you would like to see included in this document in the future, please send them to:
Clayton Wagar KD4IDN
yensid1@aol.com (fastest, since I travel 5 days a week)
wagarbc@mail.auburn.edu (ok alternate)

Outstanding questions at the time this document was released:

* Rumor of a keypad modification to the radio for "Wide band" TX, RX. If you know of this mod, please write to me, even if you wish it not to be published. This would save a number of poor radios from useless torture!

* Mods have not come from a Kenwood source, just experimentation by owners.

Hope you find all of this information useful. Again, please send corrections or additions to yensid1@aol.com or wagarbc@mail.auburn.edu.

++
TH79 Description and Impressions, by Mike Musick, N0QBF
++

Lulled by the sexy small size, I succumbed (or, rather, the credit card succumbed) and bought a Kenwood TH-79 dual-band H-T recently. Already owning a TH-78, the comparison comes easy.

SPECS. The TH-79A is a U.S.-spec dual-band transceiver, featuring coverage from 144-148 and 438-450 MHz. Receive coverage is extended on the 2M side from 118 to 174 MHz with AM in the aircraft band; there is no extended UHF coverage without modification. Max power is rated 5W on VHF and 3.5W on UHF with a

12V source; max power with stock 600 mAH nicad pack is 2.5/2.0. There are three power levels for each band - high, low, and extra-low (30mW). There are 80 memory channels, with no evident expansion capability. U.S./Canada version comes with the CTCSS encode/decode option. Going price at a 7/17/94 hamfest was $480.

GENERAL IMPRESSIONS. Tiny, tiny, tiny. Imagine putting a small duckie on the ARRL Repeater Directory - except that the 79 is narrower by about an inch. With the standard battery and not counting the belt clip, the dimensions are roughly 2" wide, 5" tall, and 1" thick. The belt clip adds 3/8" to the thickness; I left it off so it would be pocketable, and, frankly, it fits moderately comfortably in my work slacks' front pockets, which was surprising. It's tiny! (Oh, I said that already.)

The 79's keyboard has larger buttons than it's predecessor (lacks the cover, too) which are much easier to use. Control layout in general is better and even in just a couple of days I appreciated the change. No more ambiguous power switch - it's in the primary band volume knob in a normal OFF/ON/VOL setup. Secondary band volume control is on the "ring" of the freq/channel encoder knob in a coaxial arrangement.

There are no squelch knobs; it a key+knob function for both bands. Squelch control was, well, interesting. There are only six "settings", with usually only the lowest setting opening the squelch under no signal. Reading between the lines in the manual, apparently the squelch circuit is semi-automatic. I expected some limitations, but had no complaints under actual use - it worked well.

With my expected habit of putting it in my pocket, I like the control lock switch - it's *not* an F-key function, but, rather is a slide switch next to the PTT. No more fumbling around to unlock it. Unfortunately, the lock function does not lock PTT - that has to be disabled with the "Tx Stop" menu setting. I found this out the hard way by putting it in my pocket and inadvertently keying-up a repeater.

The 79 has an alphanumeric display capability of two lines of 10 characters, which is used in several ways. First, there is a "guide" facility, which provides online instruction for most operation features with a scrolling display. Then there is a "menu" function, which provides access to the settings which were normally done with obscure F-key commands in the 78. Setting the various functions is very clear this way. There is also a status review mode, where the more important settings are displayed.

Finally, the alphanumeric display can be set for each programmed channel. Seven characters positions are available, and almost the entire extended ANSI character set - that's right: lower case, symbols, and accented characters - can be used. However, alpha

display is mutually exclusive with frequency display. Frequency display mode can be selected in case you forgot what was "underneath" your programmed channel ID.

PERFORMANCE. I was impressed, without a doubt. The '79's sensitivity is markedly better than the 78, in both bands and especially in the extended portions of VHF. And, spurious signal (intermod) rejection seemed to be much better as well in the side-by-side tests.

The stock antenna, however, was awful. I bought an ANLI 5" dual-band flexi and it made a huge difference - signals just breaking squelch with the stock duck were full-scale with the ANLI.

Audio is fairly good for something so small. The quality was marginally better than the 78 and tended to distort less at max volume settings. Audio power would be stretched to use it, say, with the car window open going freeway speeds.

Having loaned my wattmeter to a friend, I wasn't able to get transmitter measurements to confirm power ratings. Reports from those on the receiving end have been favorable so far, though.

ADVANTAGES. As mentioned previously, the 79's receiver quality is significantly better than the 78, in both sensitivity and intermod rejection. Battery life - even with the smaller batteries - is supposed to be drastically improved due to a number of design changes, particularly in the transmitter finals. Have not been able to confirm that. And then there's the size.

DISADVANTAGES. There are, unfortunately, a few. One thing that jumped-out very early was that there is no facility to "lock out" a channel from the memory scan. If you select memory scan (hold [MR] for 1 second), you get every channel programmed in the band active for that "side", whether you want it or not. IMO, this was a grave over sight on Kenwood's part. If someone knows how to do this or there is a "hidden" lockout function, please post it, because nothing in the manual even hints at being able to do this.

Another disadvantage, albeit minor, is that there are no clocks or timers. I normally eschew these gimmicks, but "on the road" I've made use of the timer feature in the 78 as an alarm clock. I'll miss it a little.

It has no 800 MHz receive, which the first two generations of TH-78 has. This isn't a hard disadvantage, because the current TH-78 has 800 MHz missing, too. I only mention this for current 78 owners who have pre-4/94 units.

And, so far it seems that there are fewer "hidden" features available, like cross-band repeat. I said "so far". There appears

to be no extended F-key function activated by holding down the F key for 1 second; most of those feature selections are covered by the menu display. But there's more exploring to do and we might just bump into something interesting in the next few days - "power on" has significance in one important command (memory channel clear), so it may be important in switching other modes.

MODIFIABILITY. I studied the schematics (supplied) for the usual strap selections for extended range and different markets. Yes, they are there. When the opportunity permits I will cross-reference the mod codes against other Kenwood schematics and determine where the range extensions are. HOWEVER, there is very clear allusion to an 800 MHz receive feature, and checking the component list for the U.S. version codes, it appears that *all* of the 800 MHz components are missing. Kenwood is meeting the "no cellular" requirement purely by eliminating the 800 MHz receive section altogether. So, technically, you would probably be able to mod it for 800 MHz receive, but getting all of the right parts (about 40 or 50 surface mount components) and getting them to work without destroying something borders on improbable.

Overall, I like it, though I'm really hacked by the lack of scan memory lockout - they *REALLY* messed-up by not including it.
...mm

P.S. After another day with the TH-79, I'm bumping my head against more limitations.

Another feature lost from the TH-78: special scans. With the TH-78, it was possible to have a variety of special scan conditions. One of my favorites was to load a freq into the "call" channel, and by holding [CALL] for one second it would flip back and forth between two freqs. I used this a lot, and it just isn't there on the 79.

Also, I spent some time trying various power-on key combinations and found absolutely nothing. One thing for sure - if it isn't in the manual, it isn't likely to be discovered accidentally.

The more I "explore" this rig, the more I get the impression that feature selection may be "back to basics". Kenwood might be a little sore after the TS-50 experience with the FCC and may feel the need to make access to "tweaks" a little less obvious.

++
MARS/CAP Modification provided by Mike Musick, N0QBF
++

Here is the MARS/CAP modification for the new Kenwood TH-79A dual-band HT. Usual disclaimers about doing mods apply.

1. Remove battery.

2. Open case by first removing 3 screws (#00 Phillips) on back
and 1 screw on side hidden underneath the rubber flap covering
the DC power jack. Gently pry apart starting at top; BNC
connector will move with back, knobs with front.

3. Spread unit out. Wires will "hinge" on the side with the PTT
button.

4. Looking on the back of the keypad (front) half, locate green
wire on upper left, just below the CTCSS decoder module.

5. Neatly cut this green wire, and tuck back in so ends won't
touch each other or other components.

6. Reassemble.

Programmed memory will be lost since the CPU will notice the
strap change and reset itself.

End result -

Before: VHF RX - 118.000-173.995 TX - 144.000-147.995
UHF RX - 438.000-449.995 TX - 438.000-449.995

After: VHF RX - 118.000-173.995 TX - 142.000-151.995
UHF RX - 420.000-449.995 TX - 420.000-449.995

Automatic repeater offset and shift selections remain normal.

If I read the schematic right, the green wire corresponds to
"W301", which also serves the same purpose as removing "D308".
More research needs to be done on other mods; I'm especially
interested in extending UHF receive beyond 450.

There is a row of diodes right below the uC which appear to be
D302 through D308, the configuration straps. HOWEVER - I need to
caution anybody thinking about playing with the diode straps that
it will not be a casual operation. For one thing, the diodes are
SMD "603" style - extra, extra tiny - and the plastic board
hold-downs molded into the front case are right on the landings
for most of the diodes. This means that the board will have to be
removed from the case (a very involved procedure), and working
with the tiny diodes *will* require magnification tools as well
as the correct micro-tip iron. It is not a job for the
inexperienced or all-thumbs.

Also, as noted previously, the non-US versions of the TH-79 have
an 800 MHz receive section. All RF components of this section are
not present in the US version. Frankly, it would easier to import
a gray-market version of the radio than it would be to attempt
restoring this coverage in the US with parts.

++
"Wide Band" Modification, provided by Cole Cunningham, AA7RD
++

Following is a modification for the Kenwood TH-79A Dual Band HT which opens it up to tuning from 67-174 MHz and 400-511 MHz. Actual receive was 85-135.995 AM and 136-179.995 FM with reasonable (0.5 microvolt or better) sensitivity at all the points I measured. Transmit was 136-179.995 and 400-511 with power dropping off at the ends but still usable (about 0.5w on the high scale at the band edges).

As usual, I take no responsibility for the mods, or your use of the unit after mod. Please exercise good judgement and don't endanger our ham bands with your irresponsible actions.

The observations noted are all I tried and I have no further data. This is such a delicate operation that one shot was all I wanted to do, and when it worked I quit!!!

WARNING-CAUTION-LOOKOUT-ETC!!!
The diodes to be moved are microscopic!! About 1mm long by 0.5mm wide. This mod should be done by professionals on a closed track only. Children, do not attempt this at home. Requires extremely small soldering tools and MUCH skill. I had a professional surface mount facility do mine...

1. Open the unit by removing three screws from the back and one under the DC power input cover. Carefully separate the front and back pieces. The two case halves may be disconnected by pulling the wired plug and by prying the brown latch on the ribbon cable connector up enough to release it.

2. On the front PC board in the lower right corner as viewed from the rear with the knobs pointing up there are seven spots for diodes in a row, with one diode missing.

```
|
o o o o x o o |
_______________|
2 3 4 5 6 7 8
```

The numbers are D302-D308, left to right, with D306 missing.

3. Remove D304, and D307. Put them away in a safe place (Just in case...)_

4. You should now have:

```
|
o o x o x x o |
_______________|
2 3 4 5 6 7 8
```

5. Reassemble and good Luck.

Enjoy, but don't create problems with the new capability...Wouldn't it be nice if Kenwood would make a RX only mod with these capabilities and we wouldn't have to worry about accidental transmissions where we shouldn't be transmitting. I, for one, don't want or need to TX, just RX...

73, Cole, AA7RD
August 11, 1994

(Note - This mod also adds 2 more menu settings. One of which is an
AM/FM demod selector for the 300-400 Mhz band. To access this
band, select the VHF band, press F, then press the Low/Hi key.
Repeat to return to 144 Mhz. The AM/FM selector will allow you
to listen to Military transmissions in the 300Mhz band in
either AM or FM.
- Clayton)

++
Remote Base Operation with Kenwood 732/(733?), Clayton Wagar KD4IDN
++

Kenwood has now simplified remote base operation of their mobile rigs
with the TH79.

I will not give a step by step on how to control the mobile rigs, since
they are different. Hoewever, to really understand this feature, I would
first get to know the remote control feature on the mobile very well. This
makes the following explanation a little clearer!

To access this feature, hold [PTT] and [MR] while [POWER ON].

The display will indicate -RC-, which I presume means 'Remote Control'.

If you have correctly matched your DTSS codes, frequencies, etc, the
dual bander's keypad now becomes a function pad. Pressing certain keys
enables or disables functions on the mobile rig by sending the DTMF
sequences for you.

Please note that all this fuction does is send the DTMF tones over the air
to control your mobile rig. I have not made a list of what each key does,
but as the 79 sends the DTMF tones, the display will indicate the function.
(i.e. - RPT ON, RPT OFF, TONE ON, TONE OFF, etc.)

KD4IDN

++
Post Modification Spec Sheet, by Clayton Wagar, KD4IDN
++

Here is a small chart showing the measured specifictions of TH79
S/N 60300272 after modification. The measurements were made with an
IFR 1200S Service Monitor, on the bench, with a 6V power supply.
Your milage may vary - these are just what happened with mine, and
I would suspect that most units are pretty similar.

Since everyone else has 2 cents about extended transmit, here's mine...
I think that everyone should have the right to modify their equipment
to suit their desires, within the law. However, as someone who has
exercised that right, I also think that those who use that capability
maliciously should be hung from the highest tree... ;)

3731. For Sale: Heathkit Signal Generator

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-21 23:16:03 UTC
From: garyj74@aol.com
Message-ID: <338n7j$r6h@search01.news.aol.com>
Source record: 224757

For Sale:
Heathkit Laboratory Type Signal Generator Model IG-42

This is a real beauty. I have all of the original construction manuals, the original schematics. I even have the original box it came in. I cannot tell you if it works completely, but it turns right up and the original owner, who just passed away, was still using the piece. It looks like it uses 12au7, 6AF4, 6AV5, and OB2 tubes. They are all present and seem to be working fine.
The cosmetics are fine to excellent. All of the original lettering is as new, there appears to be no wear in the writing. The box appears to be totally intact as new, with no bumps or blatant scratches. This prize seems to be a real find for the person who collects these sort of things. Highest bidder takes it. Please respond via e-mail.

Selling Tek 485 O'scope. Dual channel. The 300 Mhz range does not work but all other ranges work up to 150Mhz. Tektronix tells me it's a switch contact. Asking $350 or will swap for Pro-43 scanner or AOR1000 (Any handheld scanner w/UHF Air). I prefer interested parties to be in the Maryland area so those interested can come by to check out the scope in person if they wish. E-mail me if interested.

3734. PC-based Repeater Controllers?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-22 01:07:28 UTC
From: bobw@col.hp.com
Message-ID: <338tog$fuo@hp-col.col.hp.com>
Source record: 224760

Anyone out there have any experience with PC-based controllers
such as the PCRC II from Personal Computer Repeater Controllers?

I've generally been a user of SCOM controllers, but a couple of
things are making me look at a PC-based solution:
1. Lots of PC hardware laying around begging to be used.
2. A particular repeater site that is not all that harsh.
3. The need for lots of autodials (>250).

Comments? Thanks in advance.

Bob Witte / bobw@col.hp.com / Hewlett Packard / PMO / KB0CY / (719) 590-3230

3735. Do artificial grounds work?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-22 01:36:53 UTC
From: nf0r@slacc.com
Message-ID: <03291CPBRCROJLYSGYW@slacc.com>
Source record: 224774

I've also noted the large number of ads for used MFJ Artificial grounds. They do work, based on two I tried while helping other cliffdwellers set up stations.

However, you can accomplish the same goal with a quarter-wave counterpoise(s) cut for band of interest. I have used zip cord or speaker wire with equal success. Bundle them together with tie-wraps or tape and run along the baseboards.

For a better rf ground try the counterpoises supplemented with a some random runs of aluminium foil under a carpet. Window screening really works well in the application, loads of capacitance.

You'll want to tape the ends of the counterpoise wires if you have small children or pets, nasty rf burns are possible.

Anyway, hope you will give this a try before plunking down some hard earned dollars for the MFJ product. I used to run a bundle of counterposies from the second floor of my condo, down the stairs and all the way to the basement for use on 10-80M. It worked pretty well! Good luck! 73 de NF0R, Dave!

Does the ICOM dual bander 2m/70cm, IC-2700 actually exist.
I've never, ever seen a posting here mentioning it.

Does anybody have one? How is it?

3740. TM-733 External DTMF Control (Updated)

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-22 04:47:00 UTC
From: st3qi@elroy.uh.edu
Message-ID: <21AUG199423473480@elroy.uh.edu>
Source record: 224764

Here is an update on Steve's post on the 733's External DTMF Control.

Note that this message concerns the control of the 733 via an HT, and not
the microphone of the 733.)

I found everything to work as Steve described except three things.

(1) I could not return to "stanby mode" by pressing "A#".
(2) To return the radio to normal operation, I only had to do the
"disable sequence" once, not twice.
(3) I also found that the remote DTMF control functions did not match
those found on page 81 of the manual. When in "External DTMF
control", the chart changes a little. The new chart is below.

Refer to this chart when using the TM-733 in "External DTMF Control".

1 2 3 A
T.ALT ON TONE ON CTCSS ON ENTER

4 5 6 B
T.ALT OFF TONE OFF CTCSS OFF TONE SELECT

7 8 9 C
CALL VFO MEMORY CROSS BAND?

* 0 # D
DOWN POWER LEVEL UP CANCEL

There are no "shifted" functions. Just one function per button.
After you hit "B" for TONE SELECT, press * or # to go up or down,
and same is true when in VFO mode or in MEMORY mode.
Tones 7, 8, and 9 mimic the three buttons at the top of the 733 mic.

I found hitting "C" changes the display to look like it is in cross-band
repeat mode (dots between 100KHz, 10KHz, and 1KHz digits), but the
radio does not actually cross band repeat. I've tried several things
to make it cross band repeat, but could not get it to work.

I've personally concluded that "External DTMF Control" is pretty useless.
I think if it could be used in conjunction with the cross band repeat
mode, the radio would then be a frequency agile remote base (like the 732).

Here is Steve's report (with my additions/corrections) if you missed it:

- Pick a UHF control frequency.
- Turn on the UHF DTSS function and select a tone sequence. (p. 89)
- Turn the UHF DTSS function back off.
- Press Band Select to move to the VHF band.

- Turn OFF the radio, press and hold [CONT SEL] while turning the radio back on, then release [CONT SEL]. The S-meter scale and the DT indicators for the UHF band will begin flashing. The LOCK indicator will turn ON, and most front-panel keys (except PWR) will be disabled.
- To begin remote control, you should key the external radio and press the following key sequency: "Axxx#" where "xxx" is the preset DTSS code selected earlier.
- If the proper code is received by the 733, the beeper will sound and the "DT" indicator will stop flashing. The radio can now be remote-controlled, using the function chart above.
- ???? To return to standby mode, press "A#" on the remote radio. ?????
- To return the radio to normal operation, turn the radio off, then press and hold [CONT SEL] while turning the radio back on.

Note: While you're in "External DTMF Control", key the 733's mic and listen to the transmitted audio while pressing some DTMF tones... and Steve thought they sounded bad while in "DTMF Feedback Mode"!!!

That's all for now!

EF Johnson Viking Ranger Transmitter - $125

Vintage AM transmitter, covers 160 through 10 meters with 75
watts CW, 65 watts plate modulated AM. Built in VFO. Uses a
6146 final.

A two-position switch has been (tastefully) added to this
transmitter on the front panel ... haven't looked inside to see
what it's supposed to do.

The cabinet needs repainting, as does portions of the front panel.
However, it works beautifully. Original Manual.

No no no!!! Radios like the Kenwood TH-78A and others can copy their memories over the air into other radios of the same brand. It's useful when you have a group of people at an event and want to set up a number of channels for everyone to use. Too bad there's no standard data format for cloning, though. It's a good idea but doesn't work unless everyone has the same radio.

We have a good source of dryfit batteries that appear at Hamfest stalls in the UK. Typically, these batteries have been taken out of alarm systems on periodic services. They are small lead/acid batteries where the electrolite is in gel form so they are sealed units. I usually buy the 12v 7ah type and I paid UKP 2.50 for the last one. They are ideal for portable operation.

The only complication is the method of charging. They need a constant voltage charger to prevent them from gassing. There are circuits around. Car chargers are not suitable.

I use the batteries to run my HT and my cellular phone. The cell phone runs for a week on one charge. I have rigged up the terminals of the battery to a cigarette lighter socket and plug my portable equipment into that setup.

Check out XPKAM by KF7XP. I'm still learning the finer points of the
program, but it gives the user the "most bang for the buck."
It provides HF rig control for Kenwood & Icom (others too, which
I can't remember), interface to a logging program (XPLOG). EGA/VPA
and SVGA (800x600) support. I have a KAM+ and Icom IC-765 HF rig.

I tried Packet 6, Lan-Link 2.32, KA-GOLD, Host Master II+,
and see XPKAM to be the best of the bunch. Your mileage may vary.

Specifics: Cost is $39. You can download a demo from Gary's BBS,

They do it over the air? Every time I've seen any information about it, it required a cable between the two radios. I'd be surprized if they do it over the air unless thay have a built-in TNC or equivalent.

> didn't notice it.

Compare the Icom flyers on the 2 radios, where they show the insides.
Looks like all they share are filters and appearance. Meanwhile the 736
has MOSFET finals and a built-in power supply. Apparently the 736 will
not run off 12 VDC.

At the Huntsville Hamfest this weekend, Icom said most backorders of the 736
should be filled this week as Icom shipped to dealers on Wednesday. Guess
we'll start hearing them on the air. Can't wait until mine arrives.

Yaesu's require a special cable.

Kenwood's radios (at least my th-78a) transmit and receive tones via RF
at whatever frequency the VFO was last set to. The advantage is that
you can clone many radios simultaneously if they are all the same
type. However, the th-78a with the memory expansion can take over 10
minutes to clone and identifying the transmission becomes a problem.
Another problem is that third party RF can interfere with the cloning
process.

Brendan Hoar (brendan@clark.net) wrote:
: I just bought a soldering station w/ a digital temperature display. The
: main reason I got it (other than the gee whiz nifty thing) is that it had
: some really fine tips available for it and I was planning on doing some
: computer board work & possibly some SMD work with it.

: My question is this: What temperature is equivalent to a 15W "low
: power" soldering iron (yeah, the blue one from Radio Shack)?

: How about the standard 30W iron?

: The temp ranges on the unit are from 320-840 degress F or so.

: Thanks,
: Brendan.

The wattage rating is more a function of how heavy a thing you wish to solder.
For fine PC traces you only need a few watts, for 12 guage antenna wires on
a windy day you might need 250 watts, and for copper water pipe you need a
torch. However for all of these, the temperature is approximately the same.
The beauty of the thermostatically controlled stations is that they regulate
the power needed to maintain temperature.

Enjoy your new tool.

3757. MFJ DSP really exists!

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-22 16:19:17 UTC
From: palmer@Trade-Zone.msfc.nasa.gov
Message-ID: <33aj65$nc8@hammer.msfc.nasa.gov>
Source record: 224776

The MFJ DSP filter appeared at the Huntsville, Alabama Hamfest.

After seeing it demonstrated by Martin Jue himself and being suitably impressed by the box, I decided to take a chance on it and buy one.

MFJ listed the product for ~$219, I bought one from a vendor for $199.

It is based upon the Analog Devices ADSP-2105.

My first impressions are highly favorable, especially on CW and other digital modes. I unfortunately do not have any experience with other DSP units, so it would be difficult for me to compare them, however if people will send me a list of questions concerning this unit I will collect them and attempt to answer them as best I can.

If there is anyone in the Huntsville area who has experience with one of the other DSP units and would like to run a side by side comparison, I would be willing to lend the MFJ unit out for a while.

Lightning recently "zapped" my 2-meter packet transceiver, and ARRL
insurance should pay me $300 to replace it. I'd like to replace the
old crystal-controlled Johnson PPL-6050 with a more-versatile unit.
A few minutes with the AES catalog gave me some obvious possibilities:

Company	RADIO	Mems	Receive	Port	Off Timer	Control	Dial	Cost	Sep. Auto Extended Data Power Timeout Remote Auto
2-meter radios:									
Alinco	DR-119T	14	130-174	No				$345	
Alinco	DR-130T	20	140-174	Yes	Yes			$399	
Alinco	DR-1200T	14	130-174	No				$394	
Icom	IC-281H	60	440 band	Yes	Yes	14		$380	
Standard	C1208DA	100	100-200 & 250-520	Yes	10			$529	
Kenwood	TM-251A	41+	440 band?	Yes	Yes	Yes	10	$530	
Yaesu	FT-2200	50	110-180	Option	10			$459	
Yaesu	FT-2500M	31	140-174	Yes	Yes			$350	
I'm NOT really looking for a dual-band (2-meter & 70-centimeter) rig, but here are some possibilities:									
Alinco	DR-570T	20	130-170 & 340-470					$649	
Alinco	DR-600T	28	150-173 & 410-470	Yes				$759	
Yaesu	FT-5100	94	130-174	Yes	Option			$750	

All have sufficient power capability and TouchTone mikes. Prices are
best I could find in my short search, but do NOT include "CALL".
Blank entries in the various columns mean "I don't know".

Another packet set-up I manage uses an Alinco DR-1200T, so I'm very
familiar with it, but, all things considered, I'd probably buy a
DR-130T before I'd buy another DR-1200T.

I owned an ICOM IC-245 and had nothing but trouble with it! (The
"vias" on the PC board were originally UNsoldered rivets, and, even
after soldering, they kept losing contact!) But my ICOM IC-28H is OK.

My wife has an ICOM IC-u2AT, and, although it has been returned for
repair, it has generally given good service.

I own a Kenwood TR-7930 and have been very happy with it.
I own a Kenwood TH-215A, and it sucks! (loose connections inside!)

I once owned a Yaesu FT-208R and was very happy with it.

If you have any comments and/or suggestions regarding which of the above
radio might be the better/best choice(s), I'd appreciate receiving them
directly by email. If any kind of consensus seems to develop, I'll
summarize with a follow-up posting.

They do it over the air. I know because I've done it, but they won't clone
the alphanumeric display info you programmed in. But freq's and offsets
work great.

Be sure to use a dummy load however since you wouldn't want to be illegal,
might take too long with no ID.

They (TH-78A's) can do it over the air. They use DTMF tones in some proprietary format which may or maynot be sophisticated at all. I don't remember which button to push but I have done it on several occasions uploading to my dads radio (who lost his memories once on accident) or even my brothers TH-78A. It is interesting to note that when the clone mode is activated that the radio output power is automatically dropped down to 20 mW. Also even though all of the memories, CTCSS tone setting for each memory, offsets, etc. are transferred, one thing that is not transferred are the alpha-numeric descriptions for each memory....rather frustrating when that is half the reason to do it sometimes...but begggars can't be choosey. Also to note, that the time to make the transfer can last a couple of minutes or better, although I haven't timed it. A pretty neat idea...especially if you were involved in a search and rescue group that all or mostly all had the same radio. This is possible...especially when I see (at least here where I live) what seems like mostly TH-78A's wherever I go....A VERY popular radio here.

Hi Doug,

IC-03N is a HT sold in Japan, and the freq range is between 430-440MHz.
Also, IC-02N is for 2m band (144-146MHz).

From: dgf@netcom.com
Message-ID: <dgfCuyBCI.90u@netcom.com>
Source record: 224784

I'm trying to resurrect an old BTI ("Brad Thompson Industries") 2000 amp; it's a 3-1000Z in a floor mount console for 80-10. The bandswitch was destroyed (toasty brown color). Anyway, presuming I can't get exact replacement parts, the complication is this: the front panel bandswitch drives two pulleys; one drives the input network selection, and the other drives the output tank coil tap selection. Even _if_ I can find a rotary switch with enough insulating power, I'm not sure if it would have the same rotational angle between positions. I'm open to any suggestions!

From: markeh@netcom.com
Message-ID: <markeh-220894113854@markeh.slip.netcom.com>
Source record: 224781

Well, I have one of the MFJ Artificial Grounds, and I think it works. I had a problem with rf getting into my recievers audio and mike circuits at QRO power levels. And I have a real ground (a long copper rod, driven into the ground immediately below my location, about 10 feet down).

The art. gnd. seems to reduce the problem. I had to add more than one radial in my room before it seemed very effective. I suppose that possibly cutting tuned radials to the bands would have been just as effective without the MFJ box, but thats more like real work :-)

The result is enough improvement to make the problem tolerable on some bands, and non-existent on others.

3766. Re: FT-530 current draw ?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-22 20:37:23 UTC
From: paulc@fc.hp.com
Message-ID: <33b2a3$ff7@tadpole.fc.hp.com>
Source record: 224785

I can give you part of the picture for single band 2M operation. The last measurement (70 mA) is equivalent to no battery saver mode, the comments following detail the ABS mode. TX with 5 watts draws about 1.5A.

Signal received (squelch open), volume at a reasonable level: ~105 mA
Signal received (squelch open), volume at quiet level: 90 mA
Signal received, paging mode on (squelch closed until code recvd): 80 mA
* No signal, paging mode on (squelch always closed): 70 mA
* No signal, non-paging, squelch closed 70 mA

In the last 2 modes (the * modes), the "smart" battery saver very quickly drops it to 60 mA; within a minute or so it's down to ~30 and at 2 minutes its down to around 20.

3767. Opinions on TS50 vs TS450 (or FT890)

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-22 21:23:48 UTC
From: robin@oleum.zso.dec.com
Message-ID: <33b514$p75@usenet.pa.dec.com>
Source record: 224790

Hi ,

I`m considering buying a TS50. I have however two others on my list the TS450SAT and FT890AT. I like the TS50 because of its size, and since a lot of my HF work is mobile, size and ease of installation is important. I really want to know how it performs as a base station HF rig also. I am not a real DX chaser or a CW operator.

Since I can find no reviews on the TS50 - the internet is the next best thing ??

Any comments on the TS450/Ft890 as mobiles or base stations woul also be very welcome.

Thanks

Robin

I checked mine when I got it, but I lost the sheet where I wrote it all down. I can give you some idea from memory, but consider them approximations. Best advice would be to get a good power supply with a nice current meter and do your own measurements for the cases you're interested in.

> power off:

What power source are you using? I did all my measurements from the power jack. If you have a battery connected, the radio will always draw current to charge it. I recall this being about 60 mA with the radio off. Current draw with no battery is almost none, just a few mA to run a regulator and the clock.

> power on (single band - no batt saver):

Not much different from dual-band standby.

> power on (single band - with batt saver):

See dual-band.

> power on (dual band - no batt saver):

This was around 110 mA, both bands on standby. It goes up if they're receiving and the volume is cranked up, of course.

> power on (dual band - with batt saver):

The most remarkable thing was how drastic the savings were with the Rx power saver. I now use the ABS setting all the time when I run off batteries. Basically, when you set the Rx interval to non-zero, it polls the receiver that often instead of constantly.

When it says 1.2 seconds, it means it! You can see the current meter give a very short pulse ever 1.2 seconds. In between, it draws almost nothing (forgot exactly how much). I was also pleased to see that ABS takes quite a while to get down to that slow a poll rate. This means you won't miss the first word of a transmission unless there hasn't been any activity for many minutes.

I wish it would autmatically disable all power saving features (and auto-power off) when it's on 12v DC, though. I'm almost always in an

unlimited-power environment when running 12v through the jack.

> TX on VHF:
> TX on UHF:

Both were about 1.1 amps draw at 12v on high-power (5W).
Surprisingly, UHF draws just slightly less than VHF at all transmit powers. I dunno why. I didn't check the Tx power saver since I think it's hokey and frequently confused. I checked the Low power settings, but I don't remember the specific current draw. I should check again.

1.1 Amps was the maximum draw. It took this from about 11 volts on up to 16 volts, where I stopped (maximum rating).

As I dropped below 11 volts, it drew less and less current, right down to 5.6 volts, where it powered down.

That's most of what I remember. It was good enough to give me an idea of what to expect and plan for as far as current draw. If there is sufficient interest, I can do more measurements and post a chart or something.

Happy Hacking!

3771. Twin-band HT recommendation?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-23 00:37:58 UTC
From: danb@acme.csusb.edu
Message-ID: <33bgd6$kat@news.csus.edu>
Source record: 224793

I'm sort-of looking for a twin-band (2m/440) HT. I've seen a number of nice-looking radios in HRO's catalog, but I haven't seen an actual selling price listed for any of them. The ones that look about comparable are:

Kenwood TH-78A (SRP: 599.95) (TH-79A looks nice too)
Alinco DJ-580T (SRP: 499.95)
Icom IC-W21AT (no SRP)
Standard C528A (SRP: 699.95)
Standard C178A (SRP: 459.95)
Yaesu FT-530 (SRP: 569.95)

I'd like opinions on the relative quality/value/features of these rigs. I'm leaning toward the Yaesu, since I've heard some pretty good things about it, but nothing is anywhere near final.

Is HRO likely to give me a good price on these rigs? What kind of real-world price would I be looking at (in particular, for the Kenwoods and the Yaesu)? What gives with the Standards? It seems like the C528A is awfully expensive, and the C178A is really inexpensive. Why is this?

Many thanks for any information! I'll summarize E-Mail if there's an interest (use the address in my .sig), or just post. Thanks again!

Hello fellow amateurs.
A friend of mine, PD0MHS, is compiling a set of documents for a new
clubstation being set up in Hungary. There is not much available over there.
For that reason, some Dutch amateurs are assisting as much as they can.
One of the items requested is the documentation set for the SB-230.
This item is rare in Holland, because the SB-230 does not conform norms set
by the Dutch equivalent of the FCC, the HDTP.
If anyone has such a doc, and is willing to send a photocopy in the aid
of our Hungarian fellows, please mail your intention to me. If more people
apply, I will select the shortest surface mail path, en mail the address
to wich the docs may be posted.
I thank everybody in advance for the effort of reading this posting, and
perhaps for willing to help.

73,
Rob, PA3AXI

Hi,

The radio station SK6AB is looking for x-tals for radios that use
multiplication by 12 in the transmitter. We're interested in the
fq. 145.500 MHz. I've seen rigs that work this way:

Storno CQM612, CQP612/512, CQF612, CQL612, CQM712
KP-202
Alpha W-63
Aga MRU-16
Sonab MR-3016
PYE M200
PYE P5000

a.o.

If you know where I can get inexpensive x-tals for 145.500, please
answer by e-mail, thank you!

3778. Yeasu FT2400H Rx mod

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-23 11:49:17 UTC
From: mensing@xerox.com
Message-ID: <1994Aug23.114917.4652@news.wrc.xerox.com>
Source record: 224712

Has anyone completed the mod for the Yeasu FT2400H to open the Rx to 118-174 Mhz?

I have noticed that transmissions in the airband (118-136 Mhz) rarely break the squelch. Is this due to the fact that the airband is AM and the FT2400H is an
FM rig or did I mess up this very simple mod? :(

Any suggestions are appreciated.

-Dave, N2PSH-

I am in the process of building a 10M to 2M transverter and I am up to the power amp. A friend gaave me a Yaesu brick rom some older radio I imagine. The module is marked with the Yaesu name and the part number VP 20BL. He had no information on the pin-out of the device if any one knows anything about it I sure would appreciate the information. Maybe in some Yaesu manual but I don't know what radio it was removed from. If you have any info please let me know.

Thanks

I owned the JPS-NIR 10 for a year and was modestly satisfied.

I bought the Timewave 59+ and it is fantastic. Nice to be able
to choose hundreds of combinations of filters. For RTTY users,
a special setting of 2.1Khz for BP, coupled with a width of
200 - 220 hz really lets you isolate a signal.

CW filters of adjustable widths from 500hz down to 10hz with
very steep skirts. You wouldn't believe how you can isolate
a weak cw signal with 75 hz for example.
(actually cant remember the lowest setting, maybe it's 20 hz)

I feed the output directly into my PK-900 so I can filter
the signals into the TNC. Allows perfect copy of RTTY or
high speed morse from the TNC.

Spend the extra coins for the 59+, you will own it for many years.

out there >about them? >73, doug

>Hi Doug,

>IC-03N is a HT sold in Japan, and the freq range is between
430-440MHz. Also, IC-02N is for 2m band (144-146MHz).

>Yuichi W0/JR0EFE

Likewise my IC-3n was a 420-430 clone of the ic-2at. Conversion of
that unit to cover US freqs required changeout of 3 xtals and
repeaking rx and tx. Due to microprocessor control of synthsizeror
in your unit you may either find it easy or impossible. I never
did figure out how to covert my Yaseau 708 acqured on same trip
to cover our fm portion of band.

From: ka5q@aol.com
Message-ID: <33d90n$6cs@search01.news.aol.com>
Source record: 224706

From: Ken Seals, KA5Q/6, Fallbrook, CA

Over the last five years I have used and owned: PK-88 (uses too much current and gets warm), KAM (excellent unit, especially with simultaneous use of both VHF and HF ports) KPC-3 (fine little tnc, uses extremely low current, nice mailbox features, small box) PK-96 (looks like a pk-88 to terminal programs such as PKGold, works great a 1200 and 9600, takes about half the current of PK-88), DRSI dual port isa board (works fb, but more arcane setup and control). We have also recently started using the KPC-9612 tnc on the backbone of our San Diego Packet Cluster. They work really great, but cost more than twice as much as a KPC-3. If you want to be able to be ready for 9600 operation either the KPC-9612 or PK-96 should be just great for you. If your budget calls for something in the $120 price range, get the KPC-3.

One really important consideration is terminal program you use with your tnc. I highly recommend the Interflex PKGold and KAGold programs for fantastic features and ease of use. 73, Ken/ka5q@aol.com

My first radio too....I love it, except for a few minor gripes....not enough
for me to tolerate sending it back to Yaesu.

>> 1. Since I had the mods done I can transmit in frequencies I'm not
>> supposed to transmit in (e.g. Police frequencies). Is there any way
>> I can turn transmit off on those frequencies alone? I've tried to do
>> this by storing the PTT disable in the memory along with the
>> frequency but it does not seem to be a setting that is set
>> separately for each memory.
>
>I did the other R15 mod that makes it out-of-band *receive* only.
>
The other alternative is to program a TX frequency inside the Amateur Band...
but how often to you need to use out of band TX?

As it is I haven't done the outband mod, though aircraft band would've been
useful the one time we were helping with a hot air balloon event. The top
screw on my radio is striped.

>> 2. I'm concerned about how quickly the battery runs down.
>
>I wouldn't worry too much about. Too many HT users get all obsessed

>its capacity or useful life. Whether you wait until the display
>blinks or just charge it when you feel like it really won't make much
>difference at all.
>
I haven't noticed the battery running down fast....my other handheld
dies even faster than the FT530....

>> 3. I'm using all the battery saving functions and I'm wondering if
>> they really do make a difference.
>
>They do! I've watched the current draw from ther radio both with and

>without the Rx saver, and the difference is significant.
>
>I usually use the "ABS" setting, which polls the signal less and less
>frequently as it remains inactive. If the frequency has been quiet
>for a long time, I usually miss the first few syllables, but the
>battery lasts much, much longer.
>
I also use the ABS all the time.....sometimes when I deliberately want to
run the battery down, but still want to monitor a repeater...forgetting
to turn of ABS sometimes translates to the battery with plenty of charge
left the next day.

>I don't use the Tx saver, because in fringe areas it drops the
>repeater between words when it turns down the output power. Also, it
>uses the received signal strength to determine the transmit power.
>This isn't a good metric, since I often receive repeaters very well
>while I can't reach them.
>
Yes, the TX saver is a real problem. I've never gotten it to work so I
always leave it off.

>> 4. Are there any cheap alternatives to buying Yaesu
>> batteries/chargers for the FT-530?
>
Yes, but I haven't tried any of them yet.
>
>> 5. What kind of antenna can I replace the standard one with to
>> improve my transmit (instead of increasing wattage)?
>
>I haven't tried any others, but I hear the AEA Hot-Rod works well.
>Ask around and maybe borrow a friend's to try it.
>
I have a dual band duck by GENESYS, its about 15" long and it works pretty
good.

Its just the right length where the radio is on my hip and the antenna sticks
up past my shoulder, but not so long that it get's in the way.

The other alternative is a shorter antenna for me....I hate it when the antenna
sticks me in the armpit.

I haven't done much in signal testing, but the stock antenna is better than
most of the other replacements that I've tried in the same size range. I've
tried ANLI's, 6" dual band duck.....its horrible compared to the Yaesu one...
I would guess that the GENESYS antenna is about one to two S units better on
some fringe stations. I can't comment on transmit range, but these things
should be related. Though my test is poor since I was comparing reception
using NOAA transmitters.....inside of a very well RF shielded hotel building.

At home, I used to run a copper cactus....I now an HTX202 on that antenna,

>Thanks.
>

I have had two S10s and have run a variety of rigs in both. At about 45 watts of power level on two meters, strange things began to happen in both installations. Both times the antenna was mounted on the driver's side near the windshield, using a 5/8 Larsen antenna. Contrary to the popular misconception bandied about by hams, the situation is improved by grounding the black lead from the radio to the body of the car with the shortest possible length, preferably about 2", especially if the mounting bracket is anchored to a plastic dash.

In my case, the windshield wipers will be triggered for an occasional sweep, probably because the rf is getting into the solid-state intermittent wiper controller. My solution: ignore it or use lower power setting. Putting a 0.001 uF capacitor in the right place in the electronic control would fix it right.

If I am using the cruise-control at freeway speeds, keying the transmitter on high power will cause the speed to increase by about 5 mph, and it drops back to normal after unkeying. My solution: ignore it or use lower power setting. Since the Speed control is bolted to the fender about 2" from the antenna mount, relocating the antenna to the back of the car would probably fix it right.

The noise on receive is likely caused by a harmonic of a clock in the microproccessor-based spark control. The harmonic drifts around and clobbers different receive frequencies at different times. Actuating

the turn signals intermittently pulls down the voltage, causing the
birdie to move either on or off your selected receive frequency. My
solution: turning on the headlights or other steady electrical load
pulls the birdie off my favorite frequency, or I find another receive
frequency where the birdie isn't. Since the Spark Control is located
about 6" from the antenna mount, relocating the antenna to the back of
the car would probably fix it right.

The CAP mod is a hardware mod, and involves opening one set of
solder jumpers. The FT-11 is one of the easiest radios to disassemble
to the board level. The jumpers are small -- you will need a FINE
tip iron and #00 solder wick. You can do it yourself if you
are adept at such things. If you are a klutz, maybe it will be
worth it to have someone else do it for you.

Hams,

I'm a biologist (ex-ham: K6TQP) with a broken piece of equipment, and I'm in immediate need of a 100K 5-watt potentiometer. I'm seriously in the boonies, being almost two hours one-way from any kind of large-scale electronic components house. Can someone suggest a phone-mail-order source for components like this? I need someone who won't blush at sending a VERY small order, and it'd be nice if they'd FedEx stuff and be at least reasonably helpful over the phone (I don't normally have things like manufacturer's names or part numbers). While I need that **()&^&% pot RIGHT NOW, the lack of a local parts supplier has been a general problem for years and I'd really appreciate any leads at all along this line. I've already tried Digi-Key and Tucker.

Please reply via E-mail if possible, but I will check this newsgroup periodically. Thanks in advance

Pardon the post on something recently brought up but
now 'out of range', but could someone mail me the
phone # and address of a place called "Merrymac" or
something similar-sounding in Texas where Radio
Shack HTs etc. can be had on the cheap. And, can
I get a 5-year warranty through them as well?
Thanks! --Bill Ruth pruth@ocvaxa.cc.oberlin.edu techtikpending

3798. Tranverting 2-Meter FM to other bands

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-24 16:50:27 UTC
From: gbaker@bbn.com
Message-ID: <33ftoj$18c@info-server.bbn.com>
Source record: 224724

I would like to know if there is any interest in FM transverters which would allow the use of 2-Meter rigs on other HF/VHF/UHF bands. This thought came to me the other day when looking at the prices of rigs and wishing that I could use my 2-meter HT on the other bands.

My concept would be to provide users of 2-meter handie-talkies a box which, when connected in series with the HT and a suitable antenna and also connected to 12VDC, would translate both the receive and transmit frequencies. This would give the user access to another band at a modest cost. Features on the HT such as memories and tone-squelch would then be usable on the new band.

I realize that similar systems have been described before, and have been documented in the Handbook and elsewhere, but these systems have been designed to allow SSB and CW translation. Also, they were not plug-and-play devices. I am interested in translating narrow-band FM only, in the following popular(?) versions. Each unit would translate from/to the user's 2M radio, to the band of interest.

2M <-> 6M
2M <-> 440
2M <-> 10M

I presume that the going price for such a device would need to be less than the cost of a rig, say less that $125.

Other characteristics would include:
- 1 to 5 watt input
- 5 watt output
- Built-in carrier operated relay
- Brick-sized to allow easy placement within vehicles
- Rugged enclosure
- Abuse-proof
- For the 440 band, a switch for the desired range. This version would also perform the repeater offset.

I would like to know if there are any commercially made units or kits available, along with company names and prices.

I would like to know what you think of such a device, along with any comments or suggestions. Any information would be appreciated.

Is this due to the fact that the airband is AM and the FT2400H is an
>FM rig or did I mess up this very simple mod? :(

>Any suggestions are appreciated.

I did the mod that REMOVES J2 and ADDS J1 and J3. Is that what you did?
This adds extended receive (as you said) but FM only! It also enables
out of band transmit. I don't believe it is in any way capable of AM.

3803. Converting a Mirage B1016 to a B3016?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-24 21:09:42 UTC
From: little@iamu.chi.dec.com
Message-ID: <33gcum$hto@nntpd.lkg.dec.com>
Source record: 224731

I have a spare Mirage B1016 that I want to use with my Yaesu FT-290 in the car. The problem is that the FT-290 puts out 25 W, whereas the B1016 only wants to see 10 W. I'm assuming that the differences between a B1016 and a B3016 is the elimination of one of the amplification stages. Unfortunately I don't have schematics (much less any other documentation), so I can't say what such a mod would entail if even possible.

Has anyone out there tried such a modification or know enough about the details of the B1016 to say what's involved?

73,
Todd

What are these voice recorders good for? Playback of your callsign? An
"answering machine" for my rig? I'm sorry you had to buy one to determine it
was worthless.

Is there anyone out there who has one that finds it a useful feature?

I was also wondering about DTMF selective calling. Every manufacturer offers
it in some fashion on some of their rigs but there is no standard. What good
is this one? I wasn't smart enough to keep from buying this one.

I have a couple of them. They have been beat about badly for the past year, still work great, haven't shed vital parts. Did buy a bigger battery pack for the rigs (8 Nicads) at the last two Huntsvill hamfests. They live in the car or on my belt constantly. They aint small, or pretty, but they are reasonable and they work well.

No, there are no mods for extended anything. And there is little intermod, either. Helical filter on front end solves that. I use mine on a discone at home and a 5/8 magmount whip on the car.

I'm happy with the price/features/performance.

Absolutely not. Most of these functions listed are not used every day.
Personally, I think what this is actually saying is that Kenwood radios are
so feature-pact that it's worth more money than what they sell it for!
I don't know, but do Icom and Yeasu radio have this many features?

I don't know about you, but I'ld rather climps at a sheet of paper than
look through the manual for something. Wouldn't you?

What is radio Cloning?

I have built a simple, single chip DTMF encoder/decoder module which attaches to my parallel port on my PC and also to an HT (similar to the way a TNC connects to a radio). This PC/DTMF module/HT then becomes my 2nd TH-78A. I can then use my (real) first TH-78A, put it into clone mode and upload all memories to the computer. My custom software decodes all the entries to text based equivialents and displays them. My software then allows you to save,load,add,delete,or modify any or all of the fields and entries. Then you can put the first 78 back into clone mode and upload all your new memories. As was stated before, alpha-numeric id cannot be uploaded. But it sure makes an easy way to backup or reprogram all 250 memory locations! I would be glad to discuss this further with anyone, either on the newsgroup or via e-mail.

In reality, some do it over the air, and some use a cable. A cable
was required on the ones that came out a few years ago, but some of
the new stuff will work over the air.

Cheers:)

I've been running an SB230 for about 10 years. Basically a 1.2 KW ssb 1.0 kw cw input linear. Standard 5 bands as it was designed 80/40/20/15/10 meters. It is conduction cooled, therefore no fan noise. Replacement tube is expensive (about $400), but I'm running my original tube! I have had some issues with the tx/rx relay...the contacts need cleaning every once in a while. Replacing tube would require some care...heat transfer to the heat sink is through a titanium oxide block...which is toxic (don't sand it and breathe the dust). More likely is the tendency to crack the feed through caps which are mechanically sensitive as you tighten the tube/block/heat sink connections. Other than the relay issue mentioned above, no troubles!

Source record: 224744

The TS-50 is a very nice mobile rig. If you are at all serious
about fixed operating, I think you'll find the TS450 to be one great
radio. I've used mine inUS and overseas and it has performed
flawlessly. Many folks have also used the TS450 mobile of course, but
it is bigger. GL es 73 de AA5NU

Message-ID: <33haki$37f$1@mhadf.inhouse.compuserve.com>
Source record: 224647

Bill Ruth pruth@ocvaxa.cc.oberlin.edu asks:

> ... I would like to know the consensus of the on-line

> ham community on the pros and cons of the HTX-202...

Here's my $.02 worth, inflated into the $64K question:

Do you want a ham-band only rig, or do you want to listen

outside of the ham bands to the public service, aircraft,

etc?

The HTX-202 is a very good 2-meter radio. It was designed

to perform exceptionally well in a high RF environment, like

downtown Fort Worth, and it does that quite well. Being

narrow banded, the tuned circuits reject a lot of crud in the

ether that wide-band radios don't reject, since they've got to

be able to hear there, for you, if you tune there.

The 202 is not modifiable! Period. You ain't gonna make it

into a VHF-high band scanner, no how, no way! There have

been "mods" that purported to do that, but they were bogus

and malicious.

The audio quality (both receive and transmitted) of my 202

is excellent (it even makes me sound good!) - and my XYL has

dragged it across the country a couple of times on business

trips and never managed to break it, so that makes it pretty

well indestructable, in my book.

All in all, if you're looking for a 2-meter only rig, I'd

suggest that the price is hard to beat, and you get a bunch of

radio for the money that you'll spend.

Wayne

Disclaimer: I don't work for Tandy, even though I live and

work in Foat Wuth... and my #.30/quarter stock dividend isn't

enough to sway my opinion of this particular Tandy product.

Date: 1994-08-25 13:42:07 UTC
From: Bren.Doreck@utmb.EDU
Message-ID: <01HGBJE6P57E004JMY@BEACH.UTMB.EDU>
Source record: 224652

Greetings all,

I was flipping through HRO catalog and saw an all band dipole that was made by Van Gordon. It was called a Shorty (overall length 70ft). this length was attained by using loading coils. I was thinking that this would be a great antenna for may situation (very limited space). It can be mounted as an inverted V also.

Has anyone ever used one? If so what are your experiences with it? If you have built something similar let me know. I am no afraid to build my own stuff, in fact it makes me feel better when I can do it myself and not buy from a manufacturer. If you could tell me where you got the plans that would be great. If it is in the ARRL Antenna book, mine is on the way.

From: EDWOODS@pactime1.sdcrc.pacbell.COM
Message-ID: <9408251519.AA15333@ns.PacBell.COM>
Source record: 224662

OK GUYS:

The complete name of the company is:

Joslyn Electronic Systems Corporation
Building N-1, Sppokane Industrial Park
Spokane, Wa 99216
(509) 922-0483
(509) 922-0686 fax
The catalog I have lists a 3 wire, 120,240 volt, 120 volts each line to neutral model 1250-33.

specs: Surge current: 10,000 to 20,000 amps on lightning waveform of 8 to 20 microseconds rise time (this is a pretty close spec to nominal 50% probability lightning waveform and current)

Life expectancy: heavy duty units 2000 operations of 10,000 amps no mention of life of medium duty units, but I'm sure its sufficient

Load Rating: Unlimited (these things are in parallel with AC line so no current flow except during, you know)

We have used these things in our outdoor electronics for years, I've only seen 1 go and that was when a 60 kv conductor dropped on a 12 kv conductor which supplied power to a transformer that fed our stuff. The arrester smoked, the electronics didn't.

Make sure your power service entrance has a good ground and that the ground is bonded to the neutral bus in the box. Oh yeah, if you don't have room in the box, some models of arresters are weatherproof and can mount on the outside of the box, leads pointing in.

Water pipe ground is not sufficient unless you can assure yourself that at least 20 feet of metal pipe in soil is available.

The two most used answers by your friendly electrical protection engineer here in Sacratomatoe are: NO and GROUND IT.

Hope this helps,
Eric NV6O

3830. Cross Band Repeat Mode on FT-5200 Audio Connection

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-25 17:29:09 UTC
From: randyh@gvgadg.gvg.tek.com
Message-ID: <33ikd5$q9b@gv-gate.gvg.tek.com>
Source record: 224657

I have an unmodified FT-5200. It is able to operate in the cross band mode by holding down the RPT button while turning on the power.

The audio seems to be coupled from one band to the other by placing the mic near the speaker. I see from the schematic that there is a CMOS switch that connects the audio in & out that is on the mic connector (signals used for packet connection to radio). Do I need to open the jumper at spot 17 to allow the cross band audio to go through this path, and not the mic - speaker?

The 911 is in perfect condition as must be the 411. Thanks.

3832. HTX-202 Low Batt Voltage Cut-out?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-25 18:18:07 UTC
From: klaudon@pica.army.mil
Message-ID: <9408251818.AA17900@batdd6.batdd1.pica.army.mil>
Source record: 224658

I have recently purchased the RS HTX-202 HT, and use it with the supplied NiCd battery pack (7.2 vdc).

This pack, when fully charged, seems to provide about an hour or two of continuous operation on full power. I wish it were longer, but it seems reasonable for a small pack. The problem I experience is as follows:

When the battery gets low (typically during a session of full-power transmitting), the BATT indication comes on the display. This is normal. However, if transmit operation is attempted, the rig will turn itself off within a second or two. In other words, the rig provides essentially zero warning of low BATTery condition, before further transmit is inhibited.

I assume that there is some kind of low-voltage cutoff circuitry. Is this the correct behavior for this circuit? Is is adjustable?

This is the 2nd HTX-202 I have owned. The first was dead on tranmit, out of the box. This unit seems to work, except for this problem. However, the VOL control on top of the HT is mounted slightly crooked, wrt the other rotary controls. Function is unaffected. It just looks bad, if you look carefully at it. Given the questionable quality record of these units, I decided to keep it, since it worked. Perhaps I'll be going for Unit # 3 soon!

If at first you don't succeed, return the unit to RS!

Please reply by e-mail - I will post summary!

: would allow the use of 2-Meter rigs on other HF/VHF/UHF bands. This
: thought came to me the other day when looking at the prices of rigs
: and wishing that I could use my 2-meter HT on the other bands.

I actually built such a device to go from 146.000 to 446.000. I have
no intentions of publishing it, however, as it is quite difficult
to get enough transmit filtering, even with spectrum analyzer to
tweak it up properly. Ended up using a tight bandpass filter
and notch filter. It would be even tougher to get the box to
cover the whole repeater band. It has a pretty decent dynamic
range, since I used a high level (meets a popular criteria
of the input intercept number exceeding the NF, dBm vs dB
at 290 Kelvin).

Dual conversion would help, except that this raises the cost
even more.

>We have used these things in our outdoor electronics for years....

Many years ago, when I first started using X10-type modules and lost a
couple after one of our (numerous) Kansas summer thunderstorms, I mounted
a Joslyn surge arrester in my main distribution box; I haven't had any
X10 loses since.

When I wired my new detached garage/shop building last fall, I installed
a second arrester in that building's distribution box (which has it's
own ground rod). I have at least 10 X10-type units in the garage, and
I haven't lost one yet (but that's less than a year's use).

Mine will show the low batt indicator only if left on receive for a long time. I dont look at it during transmit. It will not show on rx if the battery is low enough to not transmit well. It transmits a buzz if you try to transmit when the battery is weak, but the low batt will not show on rx at that battery level. If 'batt' is showing in rx mode, and I tx, the display will just go blank and the radio shuts off.

I think that there is an internal adjustment for the batt indicator. I havent tweaked mine since I usually run either mobile or headset with it and dont look at the display.

It's a great radio for the money. And it doesn't suffer from
severe intermod like radios with extended recieve coverage
(which never gets used).

I "THINK" Tokyo Hy-Power Labs markets such a device. Sort of an inverse
transverter. I believe I have the info at home. E-mail me if you want details.

klaudon@pica.army.mil wrote:

: I have recently purchased the RS HTX-202 HT, and use it with the
: supplied NiCd battery pack (7.2 vdc).

: This pack, when fully charged, seems to provide about an hour or two
: of continuous operation on full power. I wish it were longer, but it
: seems reasonable for a small pack. The problem I experience is as
: follows:

If you have drained 600 mA from this battery pack (receive current
plus transmit current) then it's doing what it's supposed to do!

: When the battery gets low (typically during a session of full-power
: transmitting), the BATT indication comes on the display. This is
: normal. However, if transmit operation is attempted, the rig will
: turn itself off within a second or two. In other words, the rig provides
: essentially zero warning of low BATTery condition, before further
: transmit is inhibited.

: I assume that there is some kind of low-voltage cutoff circuitry. Is
: this the correct behavior for this circuit? Is is adjustable?

NiCd battery discharge curves have a knee at around 1 V per cell.
7.2 V packs have 6 battery cells and the knee is at approx 7 V.
A 7.2 V NiCd pack is almost fully discharged at 7.2 V and is fully
discharged at 6V. The low battery warning will come on somewhere
around 6 V. At that point there is barely enough capacity (remaining
current) to receive. Consider yourself lucky if you can transmit the
words "dead battery". What you have described is typical for HT's.
I don't know if you can adjust the voltage which indicates low bat.

: This is the 2nd HTX-202 I have owned. The first was dead on tranmit,
: out of the box. This unit seems to work, except for this problem.
: However, the VOL control on top of the HT is mounted slightly crooked,
: wrt the other rotary controls. Function is unaffected. It just looks
: bad, if you look carefully at it. Given the questionable quality record
: of these units, I decided to keep it, since it worked. Perhaps I'll be
: going for Unit # 3 soon!

: If at first you don't succeed, return the unit to RS!

You may wish to exchange it because of the Vol control (was it installed
at an angle during assembly or did it get bent do to rough handling?)
but everything else you describe is normal operation.

: Please reply by e-mail - I will post summary!

Modifications, Undocumented Features, and Bugs for the Kenwood TM-733A.
August 22, 1994. Release 1.1

This document is a compilation of Internet messages from
Steve Haehnichen KD6RLY and Brad Killebrew N5LJV, edited by Brad Killebrew.

Extended RF Modifications

Remove power source from the radio.

Remove the display panel.

Remove the top cover the radio.

Face the front of the radio away from you.

Remove the speaker.

Looking from the back of the radio, the control board is vertically
mounted just behind the front panel wall (which can be removed easily
if better access is needed.)

Just to the right of a chip labeled XRU4066BCF and just to the left of
two green wires (B2 & B3 which are draped over the board to the rear) are
two zero-ohm SMT resistors, B0 and B1, marked "000".

Remove B0. (the one on the left - furthest from the green wires)

Taking it out might be a bit tricky. It's glued down for surface-mount
assembly. Be careful not to pull the trace from the board.

Perform a CPU reset by holding [MR] while turning on the radio. It
will then ask if it is "OK?" to reset, press [MR] again.

The ranges after modification are as follows:

Tx: 136-174 410-470
Rx: 118-174 300-470

The cellular band is indeed missing.

Removing Jumper 1 (B2) ONLY is the MARS/CAP modification. (The green
wire on the left).

DTFM Remote via Microphone

The TM-733 is fully DTMF remotable via the microphone (documented). The radio can also be externally DTMF controllable with an HT, but that will be described later.

The DTMF control keys are exactly as shown on page 81 of the manual. Note that the microphone is active all the time, so any ambient DTMF tones near your mic will also change rig settings. This includes tones coming in on the other band and out the speaker.

Cross Band Repeating

Cross band repeat isn't documented but comes ready from the factory. To enable cross band repeat from the front panel, first select a band by pressing BAND SELECT. Then, change the control to the other band by hitting [CONT SEL]. Next, press [F] for one second, then the "X" button (far right side). Decimals will appear between the Kilohertz digits, and the "ON" indicator will light momentarily. The microphone sequence to enable cross band repeat while in remote control mode is "DC".

The transmitter hang time can be toggled between 500ms to 0ms by turning on the radio with [LOW] pressed. They also recommend enabling the Time-out Timer, for obvious reasons.

DTMF Paging and Squelch

The DTMF Paging & DTMF Squelch protocol (AAA*BBB) is compatible with the Yaesu 530 and all Kenwood radios supporting this.

DTMF Monitor

There are some serious bugs in the "DTMF Monitor" feature (Page 63: [PTT] + [DWN] + Power On). This feature supposedly lets you hear the DTMF tones you are transmitting. The first problem is that it only gives you a short tone from the internal speaker. This is not true to the transmitted tone that lasts as long as you hold the key. The much bigger problem is that it mixes the desired tone and the feedback tone resulting in an almost indecodable DTMF tone. Kenwood is aware of this bug.

Front Panel

There are two undocumented icons on the display; one is the "heart" symbol. Anyone know what that's for? It could just be a spare. I noticed they used the odd "spade" symbol to indicate AM receive, so maybe these were last minute extras. Dunno..

From looking at the schematic, it seems that the only programmable memory is physically located in the detachable front-panel. I think

this means that if I use my front-panel on someone else's radio, I get all my memories and settings. Anyone try this?

The whole front panel is connected to the rig by four wires (yep, including the volume/squelch pots.) According to the schematic, these are: power, ground, data in, and data out. I'm wondering how hard it would be to make a PC interface for this thing and replace the whole display and controls with a full-screen version. It wouldn't surprise me if many of the programming limits were also imposed by the front panel, and not the unit.

Wireless Cloning

The advertised but undocumented Wireless Clone function is described in App Note AAN-0008 which they will mail out on request. (Maybe if enough people ask for it, they will include all the functions in future instruction manuals.) In summary:

- Prepare the two radios for simplex operation on the same frequency.
- Turn both radios off
- Press [CALL]+[SHIFT] + [Pwr On].
- This should place the radios is clone mode with "CLonE" on the display.
- Press PTT on the "Master" radio momentarily. This will start sending the programming DTMF tones.
- After all data has been transferred, the display of all radios will read "End", indicating success.
- If the signal is interrupted or corrupted, the "Slave" displays will read "Err". Turn them off and try again.

Notes:

- Both the Master and Slave radios must have the same number of memory channels available for each band. Example: You can not clone a stock Master to a Slave with ME-1 memory expansion.
- You can not clone between different Kenwood radio models, even if they seem identical.

Be careful when using the clone feature. It has been known to wipe out or scramble memories on the master radio during or right after clone.

Bugs and Problems

To date, I have logged two trouble reports with Kenwood.

The first is the well-known (but still denied) problem with the transmitted PL (CTCSS) tone. The tones are filthy. They contain many harmonics and synthesis noise. I'm guessing this is because they are using 7-bits from the CPU and a resistor net (DAC) to synthesize the tone. The sound/intensity of the noise depends on the actual

frequency being generated. (The PL tones also come out of the radio's speaker while transmitting. Weird, but not a problem.)

The PL noise seems most messed up (on my radio) at 107.2 Hz, where the noise beats with the tone. Go simplex and ask someone to describe the noise to you, or listen carefully to your own speaker while transmitting. Some repeaters do a better job than others of hiding the noise for you.

Kenwood's response to this complaint seems to vary depending on who you talk to. One tech (I wish I would have got his name!) acknowledges the problem, and says they are working on a fix. He guessed that it involves changing a resistor. This would imply (to me), that they are simply turning the PL deviation (strength) down a bit to hide the noise. Unfortunately, this may make the PL less reliable for getting into repeaters. This is not an acceptable fix for me, so I'm insisting that they describe the modification to me before I send the radio in for repair. So far, no luck.

Other representatives will deny that they have heard of the problem. I don't know the cause of this, because it's a well-known and frequently discussed problem among local hams.

The Service Manual specifies a test for the PL. The technician is simply required to verify that any one PL tone is between 500 and 1500 Hz deviation. This is quite a wide tolerance range! The "standard" PL tone deviation should be 750 Hz. Twice that strong might be too strong and become audible. There are no trim-pots on the PL deviation, so I'm guessing that the deviation is pretty constant from radio to radio.

The other problem concerns the DTMF Confirmation Tones. This feature is off by default (I wonder why :), while it seems pretty useful. To turn it on, press [PTT] + [Down] on the microphone while powering the radio on. This will generate short DTMF confirmation tones whenever you send DTMF over the air from the keypad. Unfortunately, it mangles the beginning of the outgoing DTMF tone! This is serious enough that most local repeaters can't detect the tone, or count it as two tones.

Get a receiver and listen to what you are sending out when the Confirmation tones are enabled. It sounds to me like they may be mixing the confirmation tone in with the real tone and getting some destructive interference. Just a guess, though.

I called a Kenwood technician (Ricardo) and worked with him on the phone to reproduce the problem there. So, as of today, this is a Known Problem, and they are looking into a fix. :-)

I am really curious to know what they would say if other folks called up and complained about this problem. Would they deny hearing about it, or would it really be a Known Problem? Might give some insight into the PL-noise denial thing anyway. :-)

Personally, I'm much more concerned about the noisy PL than the DTMF confirmation tones, since I can just shut those off and pretend that feature doesn't exist. If enough people call about the PL problem, maybe they will come out with a real fix and offer it under warranty to all the radios out there (since they're all pretty new). My guess is that it will involve a free TSU-8 tone decode module, but don't hold your breath. :-)

Check your PL, and if it bothers you, call them! Their support number is: 1-310-639-7140, and you press [2] at their voice menu to get to the Amateur Radio department (8:30AM - 5:00PM PDT). So far, they have been fairly knowledgeable and responsive, and they always call back the same day if they're busy or stumped. I just wish they would offer a real fix.

External DTMF Remote Control

The following procedure places the 733 in External DTMF Remote Control.

Note that this mode is different then DTMF Remote Mode. This mode concerns the control of the 733 with an HT, and not the microphone.

- Press Band Select and select the UHF band.
- Pick a UHF control frequency.
- Turn on the UHF DTSS function and select a tone sequence. (p. 89)
- Turn the UHF DTSS function back off.
- Press Band Select to move to the VHF band.
- Press [CONT SEL] to move control back to the UHF band.
- Turn OFF the radio, press and hold [CONT SEL] while turning the radio back on, then release [CONT SEL]. The S-meter scale and the DT indicators for the UHF band will begin flashing. The LOCK indicator will turn ON, and most front-panel keys (except PWR) will be disabled.
- To begin remote control, you should key the external radio and press the following key sequence: "Axxx#" where "xxx" is the preset DTSS code selected earlier.
- If the proper code is received by the 733, the beeper will sound and the DT indicator will stop flashing. The radio can now be remotely controlled using the function chart below.
- To return to standby mode, press "A#" on the remote radio.
- To return the radio to normal operation, turn the radio off, then press and hold [CONT SEL] while turning the radio back on.

Refer to this chart when using the TM-733 in "External DTMF Control".

1 2 3 A
T.ALT ON TONE ON CTCSS ON ENTER

4 5 6 B
T.ALT OFF TONE OFF CTCSS OFF TONE SEL

7 8 9 C
CALL VFO MEMORY REPEATER ON

* 0 # D
DOWN POWER LEVEL UP REPEATER OFF

There are no "shifted" functions. Just one function per button.
After you hit "B" for TONE SELECT, press * or # to go up or down,
and same is true when in VFO mode or in MEMORY mode.
Tones 7, 8, and 9 mimic the three buttons at the top of the 733 mic.

Pressing "C" places the radio in cross band repeat mode. You will
recognize this because the of the dots between Kilohertz digits.
After pressing "C", put the radio back into standby mode with "A#".
The 733 will now cross band repeat. To disable cross band repeat, place
the radio back into the External DTMF Remote Control with "Axxx#".
If you can read through the lines, the 733 is capable of operating
as a frequency agile remote base. Now Kenwood just needs a CW IDer.

Assembly Mode Test

In the TM-733 Service Manual, it describes a test mode that I haven't
seen mentioned anywhere else. So, here's the scoop:

Entering Assembly Mode: [CALL] + [MUTE] + [Power On]
All LCD segments should come on. (To exit, power off.)

Press the [VFO] key. *This must always be done first*
The serial port is checked and "F" with "80" on the display indicates
test passed. "1" or "2" means failure.

Different keys now show different displays, with [LOW], [SHIFT],
[TONE], and [REV] also adjusting the backlight intensity.

Set the dials to minimum, then press the [MR] key. Each of the dials
shows the digitized level.

This looks useful for checking all the keys and dials when you suspect
a bad connection.

Radio Versions & Freq. Ranges

Out of curiosity, I've been trying to figure out how other variants of
the Kenwood TM-733A can be easily "mutated" from the American "K"
version.

Here's what I've come up with so far. I'm curious to know if anyone
else has tinkered with this stuff. I figure since the radio is so
new, every one out there is still under warranty, so there probably
aren't many folks poking about with a soldering iron...

The K and P (Canadian) models seem physically identical so far. Only
the warranty card has a different part number. Is there anything else
I've missed?

The M2, M3, M4, and E2 models have the most liberal Tx frequency ranges: 136-174 & 410-470 MHz, instead of the US ("K") version's: 144-148 & 438-450.

The K version already has the widest 2m/70cm Rx range possible: 118-174 & 410-470, so there won't be any mods there.

The K and P models are lacking significant hunks of the 800 MHz Rx circuitry. In addition to some caps and inductors to link in the 800 MHz font end, IC202 is completely missing (the chip with "80R" output). I think it's a custom chip, so there's not much chance of finding one. ALL models other than K and P have this chip. If you're really desperate to get the 800 MHz Forbidden Band, you'll have to buy another radio, or try to order the chip from Kenwood Parts.

Also, K and P models have a "KCB20" for IC209 instead of KCB14. This is the "430 MHz Transmit Drive" chip. I think K is optimized for ~445 while the other is centered at ~435, but I'm guessing. The test/calibration instructions use different test frequencies for the two models, so there is probably some difference in the specs.

As for the CPU, it seems to detect which model it's in by reading pins 90 through 93 on power-up. (These are output lines to the DTMF encoder after power-up.) The pins are selectively pulled hi/low by wires and resistors to set the model.

If anyone knows how to override this setting by front-panel (software) controls, I'd be very interested to hear it!

As for hardware configuration, here's the info:

There are two wires (W1, W2) installed on the CPU board that apparently bypass resistors, tying the lines hi via 10k ohms (CP402 Rpack) instead of low via 100k resistors (CP403 Rpack). There are also three zero-ohm resistors that do something similar.
For those of you following along at home, that does indeed make five select lines, with only four going into the DTMF chip. :) I'm not sure about the fifth one, R413. It goes lots of places, including several dispersed pins on the CPU. It's only installed on the M4 (Chinese) model of the radio. Since the M4 model also uses a Chinese front-panel display, this line probably selects different glyphs and such. It's also tied into the descriptionless pin 77 of the CPU, called "RPT" (cross-band repeat?). Maybe they can't sell cross-banders in China.

The other four: W1/R410, W2/R411, R412, and R414 are the selectors that pull on the DTMF data lines. If we ignore the M4 and E models (which have more unique components), the K and M2/3 models have only these differences:

W1,2 R414
K,P Yes Yes
M2/3 No No

I'd bet one of those accounts for the different Tx range limits on the
CPU. Maybe the other allows for 800 MHz frequency tuning.

------------------------snip here and print--------------------------------

Kenwood TM-733A Quick Reference Guide by Brad Killebrew N5LJV

[#] PRESS A NUMBER, NOT THE POUND SIGN.
[KEY] PRESS AND RELEASE [KEY]
[KEY1]+[KEY2] PRESS AND HOLD [KEY1] DOWN, THEN PRESS [KEY2]
[KEY1],[KEY2] PRESS [KEY1] MOMENTARILY, THEN PRESS [KEY2]
[KEY]+[PWR] WITH POWER OFF, PRESS AND HOLD [KEY] THEN HIT [PWR]
[KEY1]+[KEY2]+[PWR] YOU GET THE IDEA.
[F] (1s) PRESS AND HOLD [F] FOR ONE SECOND. "F" THEN BLINKS.
[KEY] (1s) PRESS AND HOLD [KEY] FOR ONE SEOND.
[F],[KEY] (1s) PRESS [F] MOMENTARILY, THEN PRESS [KEY] FOR ONE SEC.

The following entries are listed in the order as they appear in the manual.

3849. Phase-locked Xtal Oscilla

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-27 01:30:00 UTC
From: geoff.kennedy@woodybbs.com
Message-ID: <93.3363.7583.0NFB2E9A@woodybbs.com>
Source record: 224688

Hi Y'all !!!

I would like to build a crystal-controlled oscillator which can be phase-locked to an input signal. Has anyone done this ??

The oscillator will operate at either 2.4576 or 4.9152 MHz, and must lock onto a 2.4 KHz audio tone (f/1024 or f/2048). Lock-in and tracking range must be +/- 2 Hz (relative to Fin). The input signal is often buried in noise.

Once locked, the oscillator should not drift too far if the input signal drops below threshold - fast lock-up and slow release.

Any ideas ??

Thanks in advance.

My HP113BR has had a mechanical failure in the clock gear train. I'd like to find a replacement for the clock assembly, or if necessary, I'd purchase a complete HP113BR. If someone out there has a working HP 115BR, that would be even better.

Also, fwiw, I'd like to find an HP106A or HP106B.

Anyone having any of these items for sale, please send me mail at knight@ka1dt.mv.com or knight@caboom.zko.dec.com. Please give condition and price in message.

Thanks, Dave Knight, KA1DT

Dear All hams,

I just order a FT-2500 and it will arrive to Hong Kong next week.
Some ham told me that the output power of FT-2500 can tune up 70watt.
Is it right ?

Hi all! Well, I have just recently took a trip to the library and
found some book on Ham Radio'ing and became deeply fascinated!!!!
But the said part is that I know nothing about Hamming and how much the
equipment costs. :(. I was wondering if anyone can please tell me
some REALLY inexpensive equipment prices and info, please?! I really
want to ham but I only have 80 bucks to spend on Hamming equipment! Help!

You're going to have a problem getting on the air for $80, but it can be done.

My first suggestion would be to attend some license preparation classes offerred by a club in your area. There are clubs in most areas that offer classes for a nominal charge. This will do several things -- first, of course, it's the best way to study for the exam. But on the topic of your letter, it will give you a chance to meet some experienced hams who might be selling used equipment themselves or know other hams who are doing so. They'll also be able to tell you about hamfests (sort of ham flea markets) in your area, which is often a good place to get inexpensive used equipment.

I don't kow whether you're interested in starting as a Novice (primarily HF - shortwave - privileges, with privileges on some higher frequency bands that aren't real popular in some areas), or a Technician (privileges above 30 MHz only, but full privileges at all frequencies above 30 MHz). With the equipment you'll be able to afford initially, if you start as a Technician, you should probably think about getting a 2 meter FM rig. This will be mainly local, but with linked repeaters in some areas, there is decent coverage.

If you start as a Novice, I'd think about trying to pick up an old tube-type HF rig. There are sometimes old Heathkit CW (Morse Code) only rigs that I've seen for close to the price you're looking for. You might also be able to get a rig with voice capability, but in general you're looking at $200 or so for even a pretty old HF rig in working order.

If you'd like to find out about clubs in your area that might offer courses, write to the American Radio Relay League, 225 Main Street, Newington, CT 06111-1494 and ask for their "Prospective Ham Package" and a list of contacts at clubs in your area.

Good luck! It's a great hobby, and although getting started with your budget won't be easy, it can be done.
Lee Van Koten/KE3FB in Md.

Source record: 224683

If you need one of the Azden 12 pin mike connectors, I can sympathize. My Azden 2000 needs a new connector also. (because of my botched attempt to repair a bad mike cord). If you contact Azden at one of the following numbers: 800-643-7655 or 516-328-7501, they will tell you that they will sell you a new connector for $15 (+ shipping I suppose). Now for the bad news, no phone orders, this amount is too small for them to bother with on a credit card. They advise you to send a check or money order and they will be glad to send you one. I still haven't ordered mine yet (I hate mailing checks, especially for $15 connectors to go on my $50 radio!) If you find another source for these connectors please post it! I have been thinking about calling some of the shops that advertise Azden repair work to see if they can supply them. I am hoping for a smaller price, or at least the ability to phone order it.

Good luck!

3860. Reviving NiCads - FT-470 Battery pack

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-28 00:05:32 UTC
From: Michael@arkas.demon.co.uk
Message-ID: <778032332snz@arkas.demon.co.uk>
Source record: 224686

Hi All!

I have an FT-470 VHF/UHF HT. It's not been used for at least 6 months, and now that I have my UK call, I'd like to fire it up again.

I think that the NiCad pack, an FNB-14, has finally decided not to hold its charge. It can sit on the charger for hours, and will attain ~6.9 V immediately after disconnecting form the charger. This is a 7.2 V 1 Ah pack. It doesn't get excessively warm during charge. However, once I connect the pack to the radio, that's it. The radio will receive for approx. 30 secs before the "low battery" light flashes up. Transmitting is right out! After a while, the pack won't even drive the display - turning the radio off and on will cause the tx light to flash momentarily (normal at turn on, I seem to remember), but that's it.

I've run the radio quite successfully using the "car adapter" and +12 V, so I can safely assume that the radio isn't dragging huge currents out of the pack. Hence, I suspect that the pack has had it ...

Can anyone advise as to the probable cause of this dilemna, and any possible restorative action that I could take? (Short of buying a new pack, that is. :))

TIA, and 73's

From: georgec@onramp.net
Message-ID: <33ovnm$a9t@news.onramp.net>
Source record: 224689

The only mods for the FT-2700 are pretty lame and useless. THere are some diodes on the micro that let it tune down to 430 and on high band up to about 153 mhz. But the vco won't make the trip, and as a result you get no real addition to the freq range.

The name of the place is Akihabara, also known as "The Electric City". It's
about three stops north of Tokyo station on the JR line. A few things to
know in advance:

1. All of the JR station signs around Tokyo have romaji characters, so an
English speaking person can find their way around.

2. Plan on spending at least one day wondering around.

3. The big ham radio stores are pretty obvious, although you'll find the
bargains in the smaller stores that don't advertise in CQ Ham Radio.

4. The standard Akihabara discount is about 20% off list.

5. A little Japanese will go a long way. In particular, learn some basic
buying and bargaining words.

Try 26.620 MHz. It's just below the bottom of the 11m band. RARELY used unless things have radically changed lately. We used to get to it by switching the channel 10 receive and transmit crystals in a Radio Shack xtal-based CB rig.

I did the mod by cutting the green wire that was shorting pads 13,
then removed both batteries for 15 mins then replaced the batteries
and powered the rig up while holding up & down arrow keys. This
cleared all memories, but had no effect on the frequencies received!

Was the green wire the wrong one? What have I done wrong?

Thanks in advance,
Steve

A characteristic of NiCd batteries is that they maintain nearly constant voltage as they discharge, and then the voltage will suddenly drop sharply. That's why you get little warning, especially when transmitting at high power. There are a few rigs out there that have a battery meter-type indicator built in. It sounds like a good idea, but I've never used one so I don't know how well they work.

Hi folks.

A friend of mine in London is desparately looking for an Icom IC502. He has already been on to Icom in this country but with no luck. Is there anyone who might have such a beast for sale. If so, could you let me know by e-mail as opposed to the newsgroup as I don't normally have access thereto.

Thanks in advance.

Ross.

Letssee.

I DON'T reccomend the radio if you live anywhere near
an urban environment, since it is EXTREMELY susceptible to INTERMOD!

We tested the rig down at my club station, W3TKQ (Check QST in 1993.)
(It's a cover page story)

The rig is a little bit bigger than the KPC3 TNC. The rig is incredibly
small for the features. I would love to have it in my shack, but the
price tag is a little bit out of my reach.

PLEASE TAKE ME SEROUSLY (sp.?) when I talk about the Intermod. We were
able to even listen on the damned thing because of the constant hammer of
interference. Buy at your own risk.

In other words: It bites.

You want a nice low impedance ground, and you can get this simply by using
a piece of flattened copper strapping, like the sheild from a peice of RG8
coax. Tie it to your rig and take the shortest possible route to the ground
point. If it is at all possible, drive an 8' ground rod close to your
operating position and tie everything to that - probably a better ground
(more direct) than your water pipe.

Good luck & 73!

For more information, you can email the ARRL's Email Information Server. Send the following message to info@arrl.org

send prospect.txt

Your "From:" field or "Reply to:" field in your message header should contain your valid email address - including the full domain name. If not, then insert the following line *before* the "send" line in the message:

reply <your full email address inserted here, without the <>! >

That should do it. Prospect.txt contains information on how to become a radio amateur.

3881. Dual-Band Antenna Tip

Newsgroup: rec.radio.amateur.equipment
Date: 1994-08-29 13:57:25 UTC
From: p653663@austin.lockheed.com
Message-ID: <33spg5$nqv@antares.Austin.Lockheed.COM>
Source record: 224608

I just purchased a Tucker dual-band-on-glass antenna. It works great but I did run into one MAJOR problem. At speeds above 60 mph the dumb coil would start whistling in the wind. After 400 miles, I had to fix it or get rid of the antenna.

The problem is history thanks to shrink-tubing.

From: ericr@vcd.hp.com
Message-ID: <CvAwCu.58p@vcd.hp.com>
Source record: 224609

It sounds like one of the NiCad cells in the pack is totally gone. At this stage your patient is dead. So, drastic measures are appropriate. Sometimes oxide can form in the cell which will prevent it from holding charge(I received this evidence as hearsay, so if someone has a better explanation, please chip in.). Occasionally, at the risk to the rest of the cells you can recover the cell by hitting it with an impulse of high current. If you can give it > 15 amps for less than a second, you may burn off the oxide and give the cell a second life. Don't do it any longer or you may find yourself with a puddle of plastic. Keep in mind that this is a last ditch act of desparation. I don't recommend it for marginal, but still good packs.

Assuming that doesn't work, look in the ham magazines for W&W. They can sell you battery inserts which are considerably cheaper than whole new batter packs. Also, their battery packs are about 2/3 the price of the Yaesu packs.

Source record: 224610

Info on grounding can also be found in the ARRL pubs: Now You're Talking, Operating Manual, Handbook. All of these reference the National Electrical Code which is what most municipal building electrical codes are based on. One of the things you want to make sure to do is bond all the grounds in the house together (because the code requires it!). So, for example, if you add a ground rod for your shack, you also need to connect that ground rod to the existing ground system in your house. For non-RF grounding, one usually uses #8 copper or aluminum wire. You could use this to connect your house grounds together for example. The reason copper braid is typically used for RF grounding is due to the skin effect -- RF travels on the surface of conductors, so the greater the surface area, the greater the current-carrying capacity. By all means, read up on it, or ask an electrician friend or get local expierience ham to help.

I have just picked up an old (30's) cabinet radio that needs some tlc and will probably need some parts as well. The cabinet is made to look like a 5 drawer chest when closed. It has all LA stations listed on the dial and Appears to get AM and some short-wave (marked Police) It has a magic eye tube in the upper left and the bezel has been badly warped by direct sun, but it appears to say Tune or tone something.

At any rate any help finding sources of info would be deeply appreceated.

There is an HRO in Van Nuys. It maybe a bit closer. If one exits
the 405 freeway at Victory and goes East. Turn right at the light
at Sepulveda Blvd. HRO is in the little shopping complex on the
right. After leaving HRO, one turns right onto Sepulveda and goes
south to Burbank. Make a right on Burbank to get back onto the
405 Freeway southbound.

Henry Radio is in West LA (even closer).

Go north on the 405 freeway and exit to the 10 freeway going WEST.
Get off at Bundy (next exit) going north. After crossing Olympic
Blvd, look for Henry's on the right side.

I have found that the prices in Henry Radio are about the same as HRO.

Not me, so far (since 1983) HRO has been higher on EVERYTHING compared to Henry Radio. Especially on Yaesu stuff. HRO typically stocks a lot of Kenwood stuff and sells it all a a little under list. They are always talking people out of Yaesu and ICOM items and selling them something else from the Kenwood lines. HRO wont deal...it's fixed price, no trade-ins and they don't carry used gear at all...besides there seems to ba a small "in-crowd" and if you're not a member or a friend of someone who is..then the staff is fairly rude!

I avoid HRO whenever possible....

For the San Francisco Bay Area:

Ham Radio Outlet, 510 Lawrence Expressway, Sunnyvale, CA 94086
(408)736-9496
Open 1000-1730 hrs. M-F and Saturday (1000-1700?)
It's about 30 miles SOUTH on Highway 101 from the San Francisco Int'l Airport. Take the Lawrence Expressway exit (also Southbound since southbound Highway 101 actually turns a bit east at that point).

or

Ham Radio Outlet, 2210 Livingston Street, Oakland, CA 94606 (510)534-5757
It's across S.F. Bay from the SF Airport. Highway 101 NORTH to I-80; SOUTH on I-880 to Oakland's 23rd Avenue EXIT; Right on Dennison; Right on Cotton or Embarcadero; Right on Livingston.

Give yourself an hour to get to either location once you locate a car or cab, just to be safe.

This would probably account for all the cellular car antennas that I see with the shrink tubing on the coil. I always wondered why, now I know. ;-)

S>I heard that HTX-202 is a very decent 2M radio for the price. RS has it on
>sale from time to time. The last time I checked was around $188 during the
>Dayton Ham convention.

The HTX-202 has 12 independently-programmable memory channels,
plus one calling and three priority channels. It comes with
continuous tone squelch encode -AND- decode. Power output is
5 watts minimum (7w typical) with 12 VDC supply, 3 watts
@ 9 VDC or 2 watts @ 7.5 VDC. Low power setting provides 1
watt output. A power saver circuit with programmable 1/2, 1/4,
1/8, or 1/16-second duty cycle. Batteries are compatible with
larger ICOM (IC-2AT/IC-32AT) series HTs.

Repeater offset can be adjusted from 0 to 4 MHz in steps as set
by the scan frequency step selection (5, 10, 20, 25, 50 or 100
KHz). Memories store any offset, and any combination of
continuous tone frequencies.

Size is 65 x 117 x 37 mm. To put this in perspective, with
alkaline packs on the 202 and my ICOM W2A, both are the same
thickness. The 202 is maybe 1/4-inch wider (at widest part),
and 1/16-inch taller (it's hard to compare because of the
irregular shapes of HTs.) The HTX-202 does give the impres-
sion of being a "mid-size" HT until viewed up against something
like the little W2A, which actually has three different "widths."

Supplied with Nicad battery, charger, 6-cell alkaline battery
case, antenna, wrist strap and belt clip.

Now, the good stuff...

* True FM modulation (not phase modulation) for outstanding
transmit audio and best performance in packet service.
* Continuous tone squelch transmit and receive tones are
independently programmable.
* In addition to DTMF dialing, there is 5-digit DTMF selective
paging (DTMF squelch).
* A five-number memory dialer that stores 15-digit sequences
for autopatch use or DTMF paging.
* Scan for either active -- or vacant -- channels, with

programmable scanning step of 5, 10, 20, 25, 50 or 100 KHz, and upper and lower scan limits (for VFO scan.)
* FAST, 25 channels/second scanning.
* Selectable priority channel scan interval, every 4, 8, 12 or 16 seconds.
* Multi-function scanning lets you scan standard memories, priority freq. memories, or a frequency range. Resume can be after 10 seconds, when carrier drops, or remain on channel (don't resume.)
* Transmit timeout - if you frequently time-out your local repeater, this circuit will stop transmitting after a preset delay (30, 60 or 120 sec.) and sound a beep. In effect, it forces you to reset the repeater before the repeater times out. Of course you can disable the timeout circuit.
* The HTX-202 carries a 1-year parts and labor warranty.

Subjectively, this HT has exceptionally strong, un-distorted receive audio you'll really appreciate when walking around the local (noisy) hamfest. You won't believe the sound is coming from an HT! Transmit audio is crisp, clear and strong.

I put a 5/8-wave mag mount on my car, and used the 202 in the very intermod-rich downtown Ft. Worth, TX area. I've never been able to use an HT on an outside antenna within 2 miles of down-town Ft. Worth before. This one performed magnificently. My ICOM 2400 dual-band mobile gets less intermod than any other radio I've used in this environment, and the HT stayed with it, toe-to-toe. When the ICOM heard intermod, the 202 heard it, but when the ICOM was quiet, SO WAS THE HT!!!!

Even more impressive, the HTX-202 heard signals through the intermod, when the IC-2400 could not pull 'em out! Reason is probably because we purposely limited coverage to ham band ONLY! It can't be modified for out-of-band receive. The design objective was to build a specialized ham radio product that does the best possible job on the ham bands, and that includes the tightest, most intermod-free front end we could design into an HT! The published spec says intermod attenuation is 60db minimum. Spurious response and adjacent channel rejection are also 60db.

The HTX-202 is based on the ICOM 02AT with certain design modifications based on Tandy's specs. These variations include the encode/decode, additional memories, and a full width LCD display. Contrary to rumor, no part of the radio is Kenwood or Yaesu! ICOM sold the rights to their design to Tandy to do with what they would.

Whan Tandy sought to produce the unit, they went to their usual

Source record: 224623

(Continued from previous message)

Korean source for cheap gadgetry: MAXON. Maxon then built the HTX-202 for Tandy, under license from Icom. The HTX-202 is surprisingly sturdy, and well constructed, considering that Maxon's Quality Control has, in the past, been suspect.

Most HTX-202s will not take a BP-7 Icom pack. The BP-8 usually works well. If the Zener diode in the bottom-feed circuit is bad, only a 9.6-vdc pack or less will work. A minor headache at the very least.

ALWAYS: Slide off your NiCad pack when using external DC power from your vehicle or a power supply! Leaving the pack on while mobile puts too much burden on the Zener diodes, and generates heat at twice the normal rate. Save your radio and take off the pack!

Unlike it's Icom brother, the 202 will not top charge an Icom pack while on external DC power. Refer to the warning above!

WARNING: DO NOT ATTEMPT TO BOTTOM-CHARGE THE STOCK NICAD PACK IN AN ICOM BC-35 OR CLONE CHARGER.

DESIGN FLAW: Some early production (S/N 2500 and down) radios had the NiCad Zener Diode located too close to the finals, causing final transistor failure when used on external DC with the pack in place. This was remedied in production, and Tandy will remedy under warranty.

Another quirk about this radio, when the battery dies, the audio quits
but it continues to send a carrier, even when unkeyed, until turned off
or another power source is applied (i.e., via DC jack.)

>Was the green wire the wrong one? What have I done wrong?

Green wire? What green wire? Pads 13 should have been shorted by a blob
of solder, not wire unless Yaesu has changed things VERY recently. The
pads are separately by only about 1/2-mm.

Suggest you reconnect that little green wire and make sure the instructions
you have are for mod'ing the FT-530 and not some other radio. Of all the
530 mods that I have read, I don't believe any mentioned a green wire.

Removing the batteries is not required. Just do the 'hold both arrow
buttons while powering up'-trick. This tells the CPU to reread the pad
settings and configure accordingly.

Good luck!

Ham Radio Outlet is not the only place to buy amateur gear in Southern Cal.
I'd suggest the Van Nuys HRO is closer to LAX than the Anaheim store, but
I generally do not shop at HRO anymore. I do most of my over-the-counter
business at Jun's Electronics, on Sepulveda Blvd., which is less than
15 minutes from LAX. I don't have the Jun's 800 number here, but you
can reach them at (310) 390-8003. There's also Henry Radio in Westwood.

In my own experience, the folks at Jun's have been much more pleasant
than the folks at Van Nuys HRO, but your mileage may vary.

Usually, the salesmen in the big stores can speak English; however, the salesmen in the small shops may not be able to speak English.

>4. The standard Akihabara discount is about 20% off list.

You can negotiate the price there.

>5. A little Japanese will go a long way. In particular, learn some basic
> buying and bargaining words.

I used to do that to buy something cheap from my home 200 miles away!
You should be carefull that the frequency range for HAM is different from that in other countries. For example in 2m band in JA, 144-146 only, in 430MHzband, 430-440 only. In addition, repeaters are not allowed in 2m band in JA, so 2m rigs don't have tx offset.

Anyway, good luck!

From: BARTSCH@A1.RCDP.GOV
Message-ID: <01HGJ0I7KNLG8ZFGU3@clyde.rcdp.gov>
Source record: 224637

The Icom BP-83 battery died on my Icom IC-2SAT HT the other day (it was about four and a half years old). The internal battery still seems to hold a charge, however.

I want to replace the BP-83 with a battery pack offered by an after-market vendor. I am aware of three:

Mr. Nicad
D & L Batteries (I think, in New York)
Alexander Batteries (in Mason City, Iowa)
Periphix

Are there others? Which do you recommend? Which will give me the best product at the best price? I think I will buy the BP-84 version (1400 m.a.h. I think, I haven't looked at the specs in a long while).
Has anyone purchased a similar high-capacity pack from one of these vendors? Did you have good luck with it?

Thanks for you comments. Post or email reponse is appreciated.

Thanks for the responses!

Yes I cut the correct wire, the problem is to remove all batteries
then hit the power button, probably draining a cap somewhere.
This permitted the extended receive.

Thanks again & 73s,

I crossposted this to rec.radio.scanner. Bob Parnass over there has an
entire FAQ file on the BC300. That FAQ file saved my BC300 from a trip
to the scanner hospital (it was a $0.99 cap).

Also, the May issue of Scanner Journal recommended a place called G&G
Communications in NY. I hope they're good, 'cause they'll have my
BC200XLT by tomorrow. :-)

They charge $30 + parts + Shipping. Xtal scanners are $25 +parts
+shipping.

I have a Kenwood TS50 I am ussing for mobile rig. I would like to know more about the optional antenna tuner for it. Is it worth the $$. I don't have any bad mismatch with my ham-sticks. I do find that the power starts to drop near the edge of some bands. Anyone have experence with the TS50 tuner. Thx John

Does anybody know if this company is still in buisness ?
Did it change the addr ?
Do they have an email address (I think inpossible this one !)

SCIENTIFIC RADIO SYSTEM INC.
367 Orchard Street
Rocherster, New York

I have an HF tranceiver from them and I am looking for
the optional ceramic filter for AM receiving.
The RTX is called SR210.

Thank everybody

I have been told there exists a modification which allows you to add both
a cw filter and a sideband filter to the TS50.

Does anyone have any information on this modification ???

>ss@jh.org Steve Steinberg Amateur Radio Callsign: _______

The green wire is the correct one. Recent production of the 530 has a green
wire on the pads to make it easier to modify. It is best to tape the ends
to the paper to keep them from creeping into a pad or the case and shorting
to something. It appears that production batch 25 and later have this wire.
(Batch is digits 3 and 4 on your serial number).

One important item not mentioned in any literature is that the reset must be
performed twice, not once for the out of band operation to take effect. I am
not sure if it needs to be in rapid succession or not. I have usually just
kept resetting until it works. Don't try to remove any batteries!

Some time ago I recieved several recommendation for a place that will
manufacture crystals for any frequency for an old HT I bought. I selected
a company that sold them for about $10 -$11 a peice. Sent in my money and
old crystals, moved, lost the company's name and address. Does anyone out
there remember making the rec. or know of the company I used. I need to
contact them with my new address as it has been several months since I sent
in the order. I fear it was not forwarded, or that they never recieved
my letter.

u !ah157@ames.arpa Subject: Genave GTx600 users PLEASE HELP 6
meter To: ham-equip@ucsd.edu

?I have the general aviation electronics gtx 600 i think 600 anyway crystal
contr o lle controlled 6 meter fm 35 watt transceiver. I need to
know what you sued for an antenna and any general info about it.
Such as range,etc. Also, i seem to be getting channel 3 tv audio
on it. I s this normal? leave mail PLEASE Rob kb8sqh

I have a GTX-600 which I have used for years as well as Icom IC-60 and
Regency HR-6. The GTX-600 is simplest design but performs well. I
have used many antenna on 6 and currently have units connected to
a Moseley 5/8 wave 6 meter antenna claiming some modest gain. I
urge you to try to locate a simple ground plane antenna made for
CB band as bassis of a cheap 6 meter vertical. You can cut the
vertical element off to raise its resonent frequency and do the
same for the radials. If the ground plane ant you acquire is fed
directly by the Coax then you have to do nothing to match (best
swr for such will be about 1.5:1). I have used many of the ground
planes which had matching stubs (hairpin loops to refine the
match. Reduce the size of the mathing stub in proportion to the
reduction in size of the driven element. Range communccating with
mobile systems is about 20-30 miles. Range communcating with other
stations operating from a fixed location / good installation may
extend out to 100 miles. I have used 8 el horizontal yagi on 6 am
and regularly worked over 100 miles out to 150 miles with less
power than the gtx-600! If you should errect a beam for use with
the GTX-600 be sure that you make/retune it for the frequncy as
any commercal antenna design will be optimised for the low end of
the band.

When sporadic E or Tropo provides the oportunity 6 meter range per
watt is great. When in college (63-65), I worked 38 states plus
Canada,Mexico, Cuba, and several of the Island and south American
countries with a 3 watt am tx and super-regen rx mobile (i was
commuting about 120 miles per day). I do not monitor the band as
I did in that period but know that openings are still fairly
frequent and the oportunity for contacts has increased with the
ham population growth. Very few people however operate 6 meter fm.

I would advise you to monitor 52.525 for random opening and QSO
opportunities if you do not have local 6 meter activity.

I do not understand your problem with the channel 3 audio. The GTX-600 is a double conversion superhet design with 10.7 Mhx and 455khz stages. The front end selectivity the rx is not great but it should not respond to the channel 3 audio (a little over 60 mhz). The interference is to close for the signal to be an image problem. Are you close enough to the channel 3 source for it to be overload related. How is the sensativity of the unit on the frequency to which it is tuned.(ie could someone have tried to _tweak_ the rx and misadjusted the rx oscilators for the wrong injection freq and could they have misaligned the front end).

Have you made any contacts with it at all?

I am not real active on 6 at this time but we do have a small amont of 6 meter fm activity in Texas. I live in north eastern Dallas County.

[Sorry about the crosspost. Wasn't sure which group this should go on]

I'm currently saving up for Ham set. I'm planning to test in October, so I have till Late December or January to save money to buy what I need. I just bought a house in a development that does not allow antenna, so I'm more interested in hand held unit.

What I'm Looking for:
- Price $300-$400
- Multiband (if possible), or a good 2m unit
- Good, realible company (heard ICOM was good)

If you have any suggestion on what to look for, please e-mail me.

Thanks for any help,
mike

From: danb@acme.csusb.edu
Message-ID: <3431b0$l0t@news.csus.edu>
Source record: 224559

I've received a few responses to my query, and a few requests for
the results, so here goes:

I had asked for recommendations among several dual-band HTs I
found while looking through the HRO catalog, including the Kenwood TH-78A
and -79A, the Yaesu FT-530, and others. I also asked for recommendations
of places to buy from.

Those who responded spoke highly of the FT-530 and the TH-79A;
less so of the TH-78A. One comment I received:

> For the money the Yaesu FT-530 is the best of the bunch.
> I like the guide and user interface on my TH79A but if I had it
> to do over I'd buy the FT-530.

I'll probably end up with the FT-530, as soon as I can pay for it.

Most of the people who answered recommended avoiding HRO. Have
others had bad experiences with them? Who would you recommend?

Many thanks to those who answered my original query, and thanks
for any information you can provide!

In my radio R13 was indeed a green wire loop, ideal for cutting. :-)
R15 was a zero-ohm resistor that needed desoldering (to inhibit
out-of-band Tx).

I bought my radio around May of this year.

Also, from reading all the mod sheets out there, the layout of the
resistor matrix is a little different too.

> Suggest you reconnect that little green wire and make sure the

Naw.. leave the green wire cut. You did the right thing.

> Removing the batteries is not required. Just do the 'hold both
> arrow buttons while powering up'-trick. This tells the CPU to
> reread the pad settings and configure accordingly.

Yep! Right on this one. No battery removal necessary, just a CPU
reset. If you remove all the batteries and drain the caps, then you
achieve the same thing, just with more hassle.

Happy Hacking!

3935. TM-733A PL Tone Distortion Fix

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-01 00:42:01 UTC
From: lonniel298@aol.com
Message-ID: <34380p$fhk@search01.news.aol.com>
Source record: 224560

Well here it is folks, hot off the press from Kenwood. A service Bulletin about the PL tone distortion fix. In a nut shell the fix is to replace 7 resistors, they are as follows.
QTY Description New
Part number
1 R542 (from 1.8K to 2.7K) RK73FB2A272J
1 R543 (from 1.8K to 3.3K) RK73FB2A332J
1 R544 (from 1.8K to 4.7K) RK73FB2A472J
1 R545 (from 1.8K to 6.8K) RK73FB2A682J
1 R546 (from 1.8K to 10K) RK73FB2A103J
1 R547 (from 1.8K to 10K) RK73FB2A103J
1 R548 (from 1.8K to 10K) RK73FB2A103J

You can now get the service bulletin from Kenwood and I would give you the number but my fax copy they sent was not readable at the part of the page. Well I don't know if it will do the job or not but there you go. If anyone has this done please let me know if it did the job or not and didn't cause any problems with anything else.
Best of 73's
Lonnie

3936. any ft900 owners out there???

Hi,

Any FT900 users out there??? What are your opinions of this radio?
Likes, dislikes - strengths, weaknesses. I have heard that it is
really just a FT890 repackaged - is this the case.

Thanks

Robin

3937. Kenwood TM-733A PL Tone distortion service bulletin. (At last!)

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-01 01:17:27 UTC
From: steve@vigra.com
Message-ID: <STEVE.94Aug31181727@susie.vigra.com>
Source record: 224566

Kenwood just released a Service Bulletin to address the transmitted PL tone noise on the TM-733A. (Yeah!!) Call the Kenwood Service Dept. (1-310-639-7140) if you want a hardcopy. Here's a summary of the text. Use it at your own risk. If you are going to get into your radio with a hot iron, you should first get the real paper from Kenwood with the drawing.

(Note that Kenwood allows licensed amateur operators to perform these modifications *without* voiding the factory warranty. I was surprised to learn this. This applies to any published Kenwood bulletin or modification. Cool, eh?)

-Steve

Steve Haehnichen Vigra, Inc. San Diego, CA
steve@vigra.com (619) 597-7080 x116 Fax: (619) 597-7094

----------8<----------8<----- CUT HERE -----8<----------8<----------

Kenwood Service Bulletin #ASB-1060 2 Pages
Subject: TM-733A PL Tone Distortion August 30, 1994

Symptom:

Transmitted PL tones at the receiving station have a relatively high level of distortion. This is easily seen when the incoming signal is viewed on an oscilliscope.

Countermeasure:

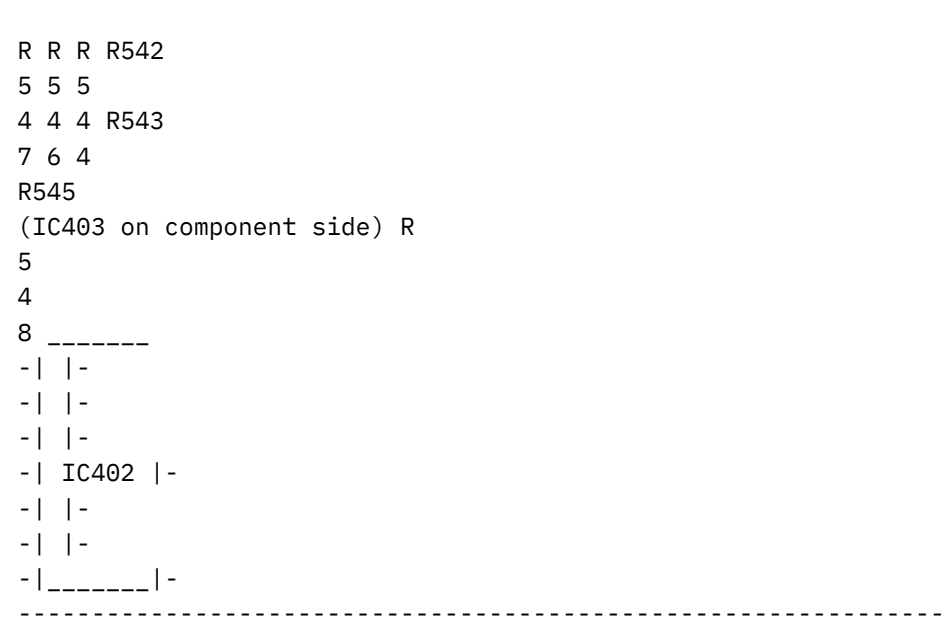
Cange the value of the "Pull-up" resistors in the PL tone encoder circuit as shown in the accompanying chart and illustration. This reduces the distortion from around 9% to approximately 4%.

Part	OLD value	NEW value
R542	1.8k	2.7k
R543	1.8k	3.3k
R544	1.8k	4.7k
R545	1.8k	6.8k
R546	1.8k	10k
R547	1.8k	10k
R548	1.8k	10k

Procedure:
----
1. Disconnect the power cable, microphone and antenna's, etc.

2. Detach the front panel and set it aside.
3. Remove the top and bottom covers.
4. Remove the speaker and speaker mounting bracket.
5. Disengage the plastic front panel from the main chassis.
6. Carefully disconnect the two ribbon cables from the Tx/Rx unit C/4.
7. Remove the two Phillips head screws that secure the Tx/Rx unit to the chassis.
8. Turn the circuit board over and replace the resistors using the parts list and illustration as a guide.
9. Reverse steps 1-7 for reassembly.

TX-RX Unit (X57-4360-00) Foil Side View



Caution: This modification requires advanced surface mount soldering equipment that is rated for CMOS circuits. It also requires familiarity with advanced surface mount soldering techniques. If you do not have the proper equipment or knowledge do not attempt this modification yourself. Seek qualified assistance from your closest Kenwood Service Center (Long Beach, CA, or Virginia Beach, VA).

MF>(Batch is digits 3 and 4 on your serial number).

The serial number on my FT-530 is 3M231517. Does that mean it is
production batch 23? If so, then the "green wire" batches started
at least at batch 23, because mine had the green wire in it and I
did the mod and it works just fine!

3939. CB antenna questions.

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-01 04:13:17 UTC
From: rblaine@max.tiac.net
Message-ID: <343kcv$g8i@sundog.tiac.net>
Source record: 224564
Cross-posted to: rec.radio.cb,rec.radio.amateur.antenna,rec.radio.amateur.equipment

Here's my situation:
I just bought a 5-watt radio shack CB and a magnetic mount mobile CB antenna. I also bought an SWR meter. I hooked it all up and it worked fine, so i started adjusting the antenna according to the manual that came with it to get peak performance. I hooked my SWR meter up, calibrated it, and got about 1.6 on channel 1 and 3.2 on channel 40. So I started trimming the antenna down. I probably took about 1/2" - 3/4" off of the length, and ended up with about 1.1 or 1.0 on channel 1 and 2.4 on channel 40. Should I keep going to get channel 40 down? Did I go too far?

Another question: People on the airwaves report my signal to me in "pounds". Someone 1-3 miles away said I was coming in at about 6 or 7 pounds. I was talking to someone 10-15 miles away as well with limited success and to someone 4 or 5 miles at 3 pounds. What is a "pound"? Will this increase as my SWR ratios improve? Will my range decrease significantly as a result from the antenna trimming?

Thanks for your help.. reply by email if possible.

I use the TS-50 as my base station radio with the matching AT-50 tuner. I run
it into a G5RV antenna. Have been very very happy with it, works extremely
well, even tunes way out of band for some of the MARS frequencies I operate.

If you have any specific questions, feel free to drop me a note.

Good idea! Bare ends poking about could be nasty. I desoldered the
wire altogether just because I had the iron hot. :-)

> It appears that production batch 25 and later have this wire.
> (Batch is digits 3 and 4 on your serial number).

> to remove any batteries!

Hmm.. I've found that it seems to act like a toggle. Once the
hardware mod has been made, it seems to toggle the extended range with
each reset. That might explain why some folks didn't need a reset and
others did.

Of course, I'm certainly not going to reset my radio a few times to
verify this. :)

I have a Standard C228A 2M/220 handheld for sale. I am a college student, and, regrettably, can no longer afford to keep it. It has barely been used, and is in excellent condition, with original packaging.

It comes with two batteries, one a standard power, and the other a high output 12V, 600mA battery.

If interested, please reply, with an offer. Thanks!

73, KD6KEH

I am not sure this was the right place to offer these for sale, my appologies if I have placed these in the wrong newsgroup.

==========

FOR SALE: RADIO SHACK PRO-2004 SCANNER w/HB-232 CPU INTERFACE

Features: 400-Channel, Cellular Restore and Speed Up Mods.
25-1300 MHZ, Wide Band FM, AM, Narrow FM, Sound Squelch

Includes: Commtronics HB-232 Computer Interface installed with MS-DOS software. Small phone jack connection on rear panel for serial interface. Adapter cable to convert to IBM 25-pin connector provided.

Includes: Service Manual, Whip Antenna.

Modified: Removed power transformer per recommendations for less heat buildup. External wall adapter included. Old xformer provided if needed.

Price: $350 COD, Includes UPS Blue Shipping

==========

FOR SALE: RADIO SHACK PRO-2021 SCANNER

Features: 200 Channels, 10 banks of 20. 110 Volt or 12 VDC operation. Includes high performance whip antenna.
30-512 MHZ in standard band arrangement.

Price: $125 COD, Includes UPS Blue Shipping

==========

FOR SALE: RADIO SHACK PRO-46 HAND HELD SCANNER

Features: 100 Channels, 10 banks of 10, 4 AA Batteries, Nicads or Alkalines, Cellular Restore Information Available.
29-956 MHZ in standard band arrangement.

Includes: Rubber Duck Antenna, AC Adapter, Service Manual.

Price: $150 COD, Includes UPS Blue Shipping

==========

If interest in any of these radios, please E-Mail me your address or call (602) 835-2243, my work number, between 8:30 AM and 3:00 PM Monday - Friday and ask for Keith and say it is about the scanners.

My secretary won't let you through otherwise.

Source record: 224572

Now here's a strange radio. It's a ham 2m xcvr on the left half of the ht (that can also receive police vhf hi band) and a wide-band 25-950 mHz am-fm-wbfm scanning rcvr on the right, with two volume and squelch controls.

By the schematic, looks to use a diode matrix to control what frequencies unit will work on, as that is how they set up if it's legal in Europe, etc. *However*, no connections are shown between the diode matrix and the processor or pll. Hmmmmmm. Anyone know the mods on this interesting radio?

BTW, the antenna for the scanner rcvr side of the radio uses a 3.5mm standard headphone mini jack! The only really stupid feature on this unit, as it falls out easily, not to get into the technical discussion of using this type of connector up to 950 mHz, heheheh. Not whole lota real-estate on top of ht for larger connector, but thought mebbe an sma type could be shoehorned in. You real experts have any other suggestions?

I only get to this newsgroup about once a month, so if ya have a hot tip, could you email ac231@leo.nmc.edu with response?

Tanks.

I'm surprised there hasn't been much or any comments about
the lousy audio output of this rig. It is definitely
inferior to the other HTs on the market (the Alinco 580
blows it away). It is not usable in a
car, hard to use on your belt without a spkr/mike at a
hamfest, etc.
Otherwize, I love it. I've had it for three years, have
worn out two batteries and no problems (its great for use
indoors where there is plenty of oudio).

3951. W9GR Digital Signal Processor forsale

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-01 15:25:17 UTC
From: mehalek@teal.csn.org
Message-ID: <CvGIu5.Fo5@csn.org>
Source record: 224584
Cross-posted to: rec.radio.swap,rec.ham-radio.swap,rec.radio.amateur.equipment,na.forsale,misc.forsale,ba.forsale,ba.market.misc,na.forsale,chi.forsale,la.forsale

Would Barry Britton please send me e-mail with his address. I have a
manual for him that he asked for!

Forsale, one very nicely assembled W9GR Digital Signal Processor as featured
in the September 1992 issues of both QST and QEX magazines. $195/bo.

The DSP has 10 different filters to choose from. What's more
these filters really work! I've used them on 20 meters many
a time, and they really make a difference in pulling in weak
signals. They are way better than a noise blanker, and can also
improve your notch filter immensely.

Filter #1 Combination noise reducer and automatic notch filter.

Filter #2 Switchable simultaneous automatic notch and denoiser filter

Filter #3 Optimized denoiser filter only

Filter #4 Optimized automatic notch filter

Filter #5-9 CW filters (I have not used these extensively)

Filter #5 400 Hz Linear Phase CW Filter (200Hz bandwidth)

Filter #6 600 Hz Linear Phase CW Filter (200Hz bandwidth)

Filter #7 750 Hz Linear Phase CW Filter (200Hz bandwidth)

Filter #8 1000 Hz Linear Phase CW Filter (200Hz bandwidth)

Filter #9 750 Hz Linear Phase CW Filter (30Hz bandwidth)

Filter #10 HF packet (1600/1800 Hz) or RTTY (2125/2295 Hz) bandpass
filter. The front panel mode switch selects either the packet tones
or the RTTY tones.

I nolonger have any HF equipment, so while the DSP is a pride and joy,
it's pointless for me to keep it, and I need the money.

I currently have the 202 and love it. I got the extended service plan to
go with it since I do a lot of hiking and am getting into emergency work
(ARES and SAR). I would get an Icom external mike/speaker for it
though. The RS mike/speaker's PTT is very stiff and becomes hard to
operate after a while. I wish it had out of band recieve and transmit
capabilities after working the fires over in central Washington last
month. It gets good hard use and keeps going. It has built in DTSS and
CTCSS on recieve and transmit, it has a nice menuized configuration setup
and is overall very easy to operate. For the price, it is the best deal
I have seen. --Ryan

Okay! I admit it, the Kenwood manual SUCKS!!!! They should hire someone that speaks English to write the stinken manual. My dad and I can't figure out how to make the DTSS function work on our new TM-732A. We followed the instructions per the manual but when we sent the station tones to the rig is just sits there acting as if we told it to do nothing. Is the manual wrong or are we missing it some where.

We set memory PA to some 3 digit number like 391. We then activated DTSS per the instruction so the DT indicator was on. We would then send the tones from a handheld rig simplex to the bloody 732 but no go. HELP

Message-ID: <1994Sep1.175105.6703@mixcom.mixcom.com>
Source record: 224497

Some have asked for the MARS/CAP/Out-of-band-transmit modifications
for the new Yaesu FT2500M 2-meter mobile.

- Remove the 5 screws (4 little ones on the side and 1 big one by the
heat sink) on the top cover.

- Remove the cover.

- Find the very obvious wire loop jumper near the middle of the circuit
board.

- Remove it or cut it and tape it off.

- Reassemble.

I received this via packet radio. I did not yet perform the mod myself.

This is obviously much easier than the tiny solder jumpers you had to
deal with on the Yaesu FT2400H, the precursor to the FT2500M. 73.

Actually if you don't mind luging a couple pound gel-cell around the
Innova 6.5Ah gell-cell would be a very good choice. It has a built in
recharing circuit. You can plug it into the car with the build in
lighter plug, or hook up at home to the power supply. At Target they go
for around $45 dollars. At 6.5Ah you could run a whole week of 3 to 5
watt transmit and continuous receive. Take a look at it. --Ryan

```
: Actually if you don't mind luging a couple pound gel-cell around the
: Innova 6.5Ah gell-cell would be a very good choice. It has a built in
: recharing circuit. You can plug it into the car with the build in
: lighter plug, or hook up at home to the power supply. At Target they go
: for around $45 dollars. At 6.5Ah you could run a whole week of 3 to 5
: watt transmit and continuous receive. Take a look at it. --Ryan

We have the same gell-cells here (Panasonic and Yuasa or somesuch) I have
used them for a week including bicycle ride public service nets (which get
talkative) and they still have good poop....the difference is cost....
I think they go for around $13 to $19 in the local electronics store. They
do sell the "used" ones cheaper, but they work quite well as long as you
make sure they have some life left when you buy them. The $19 batteries
look brand new.... They are 6.5Ah and are about 2" X 3" X 5"... weight seems
to be about 3# max???

3962. Icom IC02AT - what goes wrong out of band?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-01 20:57:09 UTC
From: larry@unbc.edu
Message-ID: <345f75$sol@unbc.edu>
Source record: 224511

Hello all:

I recently acquired an older IC02AT which has been modified to go out
of band (at least on RX) and it seems to have some sort of problem.
Years ago I had one of the same radios, but I can't recall what tricks
and traps were involved in sliding it out of band. The symptoms appear
as an apparent error in the frequency. In-band seems to work OK, at least
on RX I can't hear any frequency error. When I go out of band, to the local
police channel on 139.XX, the squelch doesn't work properly, and if I
unsquelch the radio, I can tell that a carrier and voice is there but I
can't hear them properly. If I shift up or down 5 khz, I lose the carrier.
It seems to me almost as if the frequency is falling right in between the
proper channels, i.e. 2.5 khz off. Does anyone have any experience with
this sort of problem? Do I need a recalibration of the PLL reference, or
does the VCO tank circuit need modifications?

Thanks,
Larry Gadallah VE4TCP/VE7

HRO in Portland, OR is outstanding in any category. While I was
in the store I listened to a phone call that they were handling from
some real jerk customer. It sounded to me as if they were doing everything
they possibly could to help this person including paying for shipping that
they normally don't pay for (overnight delivery for some item). Their
prices were also in the competitive range.

They were very helpful and friendly to me. My next purchase will be from
HRO.

: Thanks,

: Kay Pleyte, N9XCX
: kpleyte@post.its.mcw.edu

There are two very different reasons for ground connections. The National Electric Code, and safety considerations, require you to connect the chassis of the radio to earth to prevent the possiblility of 60 cycle power from flowing through you.

The other reason relates to RF. The length of the wire/cable creates an impedance. If you operate on 10 meters, and the length is 1/4 wave length, or 2.5 meters, even a very fat wire can look like an open circuit! The building inspector may be very pleased with the installation, but you could have lots of RF voltage on the microphone.

New radios are usually accompanied by simple antennas. Hey you got to start somewhere! If you use a wire dipole, attempt to make it symmetrical, and use a balun of some sort to reduce the amount of RF that feeds from the antenna down the outside of the coax to the shack. My preference is for baluns made of coils of coax, but others can also work.

Have fun getting your rig on the air.

: antenna. I also bought an SWR meter. I hooked it all up and it worked
: fine, so i started adjusting the antenna according to the manual that
: came with it to get peak performance. I hooked my SWR meter up,
: calibrated it, and got about 1.6 on channel 1 and 3.2 on channel 40. So I
: started trimming the antenna down. I probably took about 1/2" - 3/4" off
: of the length, and ended up with about 1.1 or 1.0 on channel 1 and 2.4 on
: channel 40. Should I keep going to get channel 40 down? Did I go too far?

You need to trim it a bit more. Expect the SWR to go up a bit on channel 1.
You have a couple of options. You can tune for the lowest SWR on the channel
you use the most - or you can do so for a channel in the middle of the band,
somewhere around channel 20.

: Another question: People on the airwaves report my signal to me in
: "pounds". Someone 1-3 miles away said I was coming in at about 6 or 7
: pounds. I was talking to someone 10-15 miles away as well with limited
: success and to someone 4 or 5 miles at 3 pounds. What is a "pound"? Will
: this increase as my SWR ratios improve? Will my range decrease
: significantly as a result from the antenna trimming?

Pounds are just as meaningless as S units. There actually is a standard
for the S unit calibration, but no CB radio manufacturer abides by it.
The indication is meaningless - except as a relative indicator. Two rigs
sitting side by side can easily produce a completely different S-meter
reading.

There will be only slight, if any, improvement in the reading as you improve
the antenna tuning. Nor will your range increase.

Bill

RB>Did I go too far?

What I would suggest is to set your peak performance for ch 19 or 20,
which is the center of the band, and you can tell when you are set near
the peak when ch 40 and ch 1 are near equal, and 19 is near 1.0

RB>Another question: People on the airwaves report my signal to me in
RB>"pounds". Someone 1-3 miles away said I was coming in at about 6 or 7

RB>"pound"? Will this increase as my SWR ratios improve? Will my range
RB>decrease significantly as a result from the antenna trimming?

They are reporting to you the dB of the signal they are receiving, and
in CB lingo, this is commonly called "pounds".

The closer you get to 1.0 on your SWR, the stronger your signal. Also if
you get a noise limiting, or amplified mic., your signal will be more
readable at the outer limits. Also placement of your antenna is
important. If you mount your antenna on the rear of your car, you
usually will get a stronger signal forward. I also prefer "base loaded"
antennas, they seem to work better with my experience.

JJKJ>Just picked a used icom w2a dual band ht. Really pleased with it.

What will you be using it for???

Periphex makes alternative power sources for you - their BP-84S is a 1400mah 7.2V unit - whereas the Icom BP-84 is only 1000mah. And, of course, the Periphex is over 20 bucks less!

For real long-term, portable power, you can't beat the Ham Battery from Quantum Instruments for quality, construction, and design. 2.1 Amp-Hours! Buy a Quantum Ham Battery PLUS their HB-3 Adapter, and it'll cost less than a Quick Charger and a second Icom battery! (Hey, us Bradfords can rationalize ANYTHING!!! <grin>).

Accessories all depend upon how you are intending to use your unit. You might be satisfied with a couple Icom batteries and a Diamond RH-77CA antenna. Or, you might want to get a 12V power supply for base use.

From: clint.bradford@ectech.com
Message-ID: <940903013639460@ectech.com>
Source record: 224502

The HTX-202 will accept some of Icom's batteries (Periphex, too!) for additional power. I also use my HTX-202 with Quantum's 2.1AmpHour HAM BATTERY (with Quantum's HB-4 Adapter).

For both of you, here's some HTX-202 Battery texts I have collected:

Most HTX-202s will not take a BP-7 Icom pack. The BP-8 usually works well. If the Zener diode in the bottom-feed circuit is bad, only a 9.6-vdc pack or less will work. A minor headache at the very least.

ALWAYS: Slide off your NiCad pack when using external DC power from your vehicle or a power supply! Leaving the pack on while mobile puts too much burden on the Zener diodes, and generates heat at twice the normal rate. Save your radio and take off the pack!

Unlike it's Icom brother, the 202 will not top charge an Icom pack while on external DC power. Refer to the warning above!

WARNING: DO NOT ATTEMPT TO BOTTOM-CHARGE THE STOCK NICAD PACK IN AN ICOM BC-35 OR CLONE CHARGER.

From: nf0r@slacc.com
Message-ID: <031633RSMERINMWHWPYC@slacc.com>
Source record: 224509

I recently acquired a Mac-Key P-500 bug. It is in the original wooden shipping box and has the Mac-Cord assembly.

Wondering if a serious key collector can tell me roughly when this bug was manufactured? I'm guessing it's post-WWII but.....

Also, this particular example has identical flat (shaped) fingerpieces but no round knob on the right side. Is this common or is the knob missing. The plastic finger piece shows no signs tha it was ever installed (circular scratches etc).

Finally, did Mac-Keys come with an "owners manual"? I would assume so. Is there someone I might be able to contact to get one.

Thanks for wading through this. Any help you can pass along will definitely be appreciated. 73 de Dave nf0r@slacc.com

Wonder if Kenwood started including the FIX with certain serial
numbers? I have not noticed the problem on my TS-733A. I have only
had it for about two weeks. Hate to send it to Kenwood for an
extended vacation if the fix is already included from the factory.

My S/N is 60102204

I to have a TM-732a and I have no problem with the DTSS feature although
I don't use it now.

Do you have the TSU-7 (DTMF/CTCSS decoder unit)?
One possibility of a problem is if the radio that you are sending DTMF is
not sending clean DTMF. Many radios, including brand new ones, have to
have the DTMF checked to make sure they are producing the correct tones.
If the radio works with other DTMF equipment the tones might be marginaly
bad. or possibly the sending unit is too close to the 732 and overdriving it.

Try that and let me know...

Yes, the green was the right wire. The reason mine didn't work right
away is that I needed to power up the HT with no batteries. This did the
trick.

Too bad they don't give you a wire to cut for extended rx only (w/o
extended xmit).

Thanks for everyone's help,

>extended xmit).

Well...that depends on the user. Some would prefer a mod to eliminate the possibility of extended ANYTHING! My preference is for a ham band only rig that doesn't receive out of band signals. I prefer solid radio performance, not a poor excuse for a scanner. Perhaps Radio Shack will come out with a dual band transciever that will fill the bill for those who want two bands. Their 202 is a nice rig.

In any case,I have an ICOM 32AT dual bander and rarely use it. I find carrying around my 2AT a much better idea. Much more conservative on batteries. When I need PL, out comes the Radio Shack HTX202.

4004. Do you know what a Twinplex Combiner is?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-04 16:49:13 UTC
From: dsilver@panix.com
Message-ID: <34ctq9$avv@panix.com>
Source record: 224532
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

In the hope that someone out there might know of someone who might be interested in this equipment before it goes into the junkheap, I ask the following question:

Anyone interested in a Twinplex Converter and Twinplex Combiner made by Northern Radio Company in the 1950's? I believe this equipment was used to multiplex/demultiplex 2 non-synchronous telegraph transmissions.

This stuff is in immaculate condition, there are manuals, and if there is any chance that anyone out there collects this stuff, or has any other use for it, I'd really like to find out.

Sorry for the interruption, and now back to our regularly scheduled programming.

> hamfest, etc.

I've used mine in my extremely-noisy four-wheel-drive vehicle, and I've had to treat it like a mobile phone if the spkr/mike is not plugged in! I've seriously considered routing the audio through the car's sound system. Another way would be to lash up a headset-mic and PTT box similar to that which was available for the previous model of radio from Yaesu. I've never seen a set-up like this produced by Yaesu for the '470, though.

> Otherwize, I love it. I've had it for three years, have

Source record: 224533

Hello!

I wonder have anyone tried to modify a GMRS - handie talkie to 70cm?

Are the radios for GMRS crystal controlled or what?

The price rate, abt $100 seems to be a right rate for a 1ch 70cm radio,
to monitor and operate a local repeater.

Please e-mail if you know anything!

/Erik

One of the largest retailers in DC area is the Electronic Equipment Bank
(EEB) in Vienna, Va. Another dealer in the DC area is Ham Radio Outles in
Woodbridge Va. You are comming during one of the peaks of the hamfest
season. I don't have dates, but the Gaithersburg hamfest is early in
September, and there are others up and down the coast within 150 miles of
DC during September and October. Happy hunting!

I called Kenwood. The models with the fix at the factory in Japan start with
serial number 605. I was told some units starting with serial number 604
were modified at the distribution point in Los Angeles. Additionally, some
retailers have sent their units on the shelf back to L.A. to get a firmware
update, and *perhaps* some of those have had the PL tone fix.

Best wishes

NETSIG, BBSSIG, and TAPR-BB Relocation

The NETSIG, BBSSIG, and TAPR-BB mail lists will be relocating back to their permanent home on TAPR.ORG.

These lists were moved to TCET.UNT.EDU after a mail problem with our host feed in Tucson during June. The TAPR.ORG system has been moved to a permanent Internet location, which no longer presents this problem. With the creation of the new TAPR.ORG system, we are working on consolidating TAPR information feeds.

In addition, the new listproc software works much more reliably than the current hacked software that was done to maintain the current lists.

These lists (located on TCET) will be phased out on Friday Sept 16th. Messages posted, after Wednesday, Sept 7th, will be forwarded to the new lists located @tapr.org.

Due to a difference between how the current and new list software operate, subscribers will need to subscribe to the relocated lists.

subscribe

To subscribe to the relocated mail lists send a message to `listserv@tapr.org` with the following line(s) in the body of the message:

subscribe list full_name

Example:
subscribe bbssig FirstName LastName
subscribe netsig FirstName LastName
subscribe tapr-bb FirstName LastName

Note: The Listproc uses the From: line of the incoming mail subscription to set the return e-mail path. If you have to support something other than what is sent in your From: line, please send mail to wd5ivd@tapr.org and let me know what needs to be supported. If you have more than one mail address you send messages from, you will need to send those to wd5ivd@tapr.org to

add those as aliases to your entry.

unsubscribe

There is no need to unsubscribe from the TCET mail lists. This information
is for later reference. To unsubscribe later from the mail lists send a
message to `listserv@tapr.org` with the following line in the body of the
message:

signoff bbssig
signoff netsig
signoff tapr-bb

Archives

Past messages from the mail lists are available in the TAPR.ORG archives.
Send mail to `listserv@tapr.org` with the following in the message body:

index tapr/mail_list

Examples:
index tapr/netsig
index

Help

To get help, send mail to `listserv@tapr.org` with `help` in the message
body. The new Listproc software does a lot of things that our previous and
current software did not support.

If you have any questions or concerns, send mail to wd5ivd@tapr.org

What zener diodes are you refering to? If you mean D4 and D5, they are 1N5819 schottky barrier rectifiers. These diodes OR the battery and external power into the radio, and one of them will always be reversed biased. There will be some reverse current, but worst case with a stone dead ni-cad pack and 13.8V external power, and Tj=125C , is about 10mA, or .134 watt ((13.8-.4 forward drop)*10mA).

From: michael.moore@24stex.COM
Message-ID: <9409050854.0CINW00@24stex.com>
Source record: 224451

Marv KD4EGV/AA asked about the Alinco six-meter FM mobile.

Alinco has an ad for same in the Sept, issue of CQ Magazine.
No price info or much else in the way of info save that the radio
is only ten watts out :(. I was told many years ago that 50 mhz
in Japan was sort like CB in the U.S. or a no-code band. The last time
I saw a copy of Japanesse CQ there were tons of 6-meter radios. Too
bad that the manuf. don't see fit to import some of these radios at
a reasonable price.

Also, has anyone had any experience with the BAYCOM tnc that sells for
about fifty dollars???

From: starin@netcom.com
Message-ID: <starinCvnzwu.G0H@netcom.com>
Source record: 224452

I am looking for plans to do the following:

1) Convert a standard car radio so it can receive transmissions in the 460Mhz range of the radio spectrum, and;

2) Construction plans to build a miniature receiver capable of receiving transmissions in the smae range of the radio spectrum. I understand for this I may need to use crystals, and that's okay.

Any help or pointers on where I can find such information would be greatly apprecaited.

Thanks.

I have one of the Baycom TNC's. Paid 40. for mine about two months ago.
It works fine, and is the way to go IF you dont really know if you want
to continue or put a lot of cash into packet. It does work real nice.
I have mine hooked to a notebook computer and into a Yaesu FT411 HT.
I went that road instead of shelling out some $200-$300 for one of the
other units.

Jeff,

If you want to go cheap and buy new, you'd be quite happy with an MFJ-9040 in the shack this winter. That's the 40M unit. They show up on the net every now and then, that's where I found mine.

I also have a bunch of Ten*Tec stuff, Powermites and Argonauts. Argonauts are superb but quite hard to find and getting expensive as they are considered collectable. Powermites are awfully cute and awful radios :-)

Hw-7's and 8's are almost as bad as Powermites, with direct conversion receivers and the nonsense that goes along with that design. HW-9's are awesome and, again, getting rare.

If you have lots of money (and time) you could order the incredible Index Labs QRP Plus rig. $600 + a six or more month wait. Ten*Tec also makes an Argonaut for $1,200. You'd have to be quite nuts to order one at that price. The TenTec Argo (a Scout w/o a PA stage) is also available for about $500.

73 =paul= wb8zjl

Oh... almost forgot, a week ago I finished my "Dan's Small Parts and Kits" 20M QRP transceiver. At about $40, I worked into europe on it with 1 watt out into my dipole. Cheap!

4036. How to ground a second story shack?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-06 02:50:22 UTC
From: herbr@netcom.com
Message-ID: <herbrCvot7y.3zC@netcom.com>
Source record: 224463

I am trying to set up a ham shack in the second story (upstairs) of my house. Based upon where the shack is located, I can't easily get to a cold water pipe, and the run to an earth ground is going to be 40feet or so. I wanted to use the copper foil that is 3-4 inches wide to run to the earth ground, but beacuse of the length of this run, I don't know if I will be creating more problems than I will solve.

Does anyone have any suggestions on providing the best ground possible for HF when the shack is located on teh second floor?

Any thoughts or suggestions would eb appreciated.

Thanks.

4037. DR 600 T - does anyone have a working one ?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-06 02:56:23 UTC
From: dismondo@metronet.com
Message-ID: <CvotI0.DwA@metronet.com>
Source record: 224464

I received my radio on August 11 1994. I put in my car with a diawa DX10D duplexer to hook the radio up to a dual band antena. I check the SWR on the line with my Diawa SWR meter. It read 1.2:1 for the 2 meter side and 1.3:1 for the 70 cm side. On August 15 the finals for both sides had gone out. I called alinco and they had me send it in for repairs. On August 26 it came back and I put it back in my car. As a good PR move Alinco sent me a free tone decoder for the radio. (yeah !). However, about 2 hours after the radio was in my car the power switch quit working. The only way I could turn the radio off was to unplug the fuse connector. Then about 5 hours after installation, the microphone quit working. I hooked the power meter back up to the radio and saw that power was being sent forward but no one could hear me on the repeater any more. It happend suddenly in the middle of a contact. After all this I discovered two other unhappy owners of this particular radio. One of whom had the same power switch problem. The other had a radio with the 440 finals shot, and also had noticed that the cooling fan makes some very obnoxious RFI. My radio goes back to Alinco tomarrow. I just hope that it dones not come back with yet more problems. Out of all this I would like to know if anyone else has had the same problems with this radio ? Is this just a problem with my radio or is there a wide speard problem with the DR 600 T, or does Alinco just make really stinky products ?

dismondo

: Any thoughts or suggestions would eb appreciated.

Herb -

I can't comment on your idea of using wide foil for your ground lead as I have no relevant experience. But I can give a word of advice regarding resonance in the ground lead itself.

Any ground lead you run will be of a length that will be near to an odd number of quarter-wavelengths on one or more bands. On those bands its r.f. impedance will be VERY high, nearly an open circuit, so you will have no grounding at all on those bands. The solution is to run at least two ground leads, of different lengths, in parallel.

Good luck and 73,

Van - W8UOF

ALINCO DR600-T and Diawa diplexer

I have two DR599-T and have had no problems....However, open up the
Diawa diplexer and look carefully for an intermittant solder joint.
My unit would initiate packet contacts and after a minute or so I would
lose the connection. Put a watt meter in line to see what was going
on and the diplexer would show an open after a short period of transmissions.

I am just getting into Ham and have what is probably a naive question :)
I would like to be able to communicate station to station with somebody
that lives about 50 miles away. Will two 2 meter HTs be able to do this?
I will have a Kenwood T22AT running at 5 watts with the stock rubber duck
and the other party will probably have a Radio Shack 202 running at 4 watts
with stock rubber duck as well. Any problem with communicating clearly
at this range? If not, what would be the best way to extend the
range? I live in an apartment so any antenna will have to be small
enough to set up on my patio or possibly in my vaulted ceiling.

Thanks

Might I suggest using copper pipe, half inch or so. This is much
cheaper than a long length of heavy gauge wire and probably
works better.

> with the DR 600 T, or does Alinco just make really stinky products ?

You might have a lemon. No matter how carefull a manufacturer is, some lemons will be sold. The difference is how they act when a lemon is found, and it sounds like Alinco has tried very hard to put things right. But sometimes even that fails.

I own a 24T (1987 vintage dual bander), a pair of DR1200's, a DJ1FT, and a DR-600T. Asside from the LCD backlights burning out on one of the DR1200's within 2 years of 24 hour service I've not had a single problem. I know of 2 other trouble free DR-600's

I would guess your mic failure is due to the radio's disassembly for repairing its finals. You might open it up and snug any connectors before sending it back. Of course you ought to ask Alinco if this will void your warranty first. Last week a brand new Icom IC-736 arrived after waiting a couple of months. Worked great except when keyed, a motor or something inside went "thump" about once per second. Sounded a lot like the antenna tuner's motor was still running against a stop. Opened the case, re-connected power and dummy load and keyed the Tx. Found a wire tie around a pair of wires fit nicely thru the grill over the front fan while the wire crossed the grill and could not fit thru (thankfully). The wire tie prevented the fan from starting. The fan would try again once per second. Pushed the wire out of the way and spent the next hour admiring the inside of the radio before putting it together.

I'd probably not have posted this to the list if you included your email address in the body of your message. Those of us who subscribe to the digest lose the header containing the direct reply address.

John,

All I know is that it is a VERY nice unit. I've never seen one although several friends got to play with one at the QRP party in Dayton this year.

It's General Coverage, full ham band TX, I think 160M through 10M.
CW and SSB, some kind of SCF unit for filtering, digital tuning, etc.

Quite state of the art. Handmade too, hence the L O N G wait for one.

If you cut down all the trees between the two of you and buldozed the homes and everything, could you see each other? If not then the answer is a probable no. If yes then the answer would be a most likely yes. 2m is pretty much line if sight.

However a few weird things can happen that blows the line of sight rule. With Ducting a weather system creates and RF duct that efficiently caries RF waves for long distances. I think this happens mostly in Florida and like areas. Another is Knife Edge Difraction. I use this one all the time. If you have a sharp rocky peak between yourself and the target station, the radio waves will hook over the peak to give you a very good signal on the other side. I can make autopatches in the mountains at 1watt with a 1/2 wave end fed vertical with multiple peaks and with the repeater over 70 miles a way with no noticeable multipathing. Another thing that can happen is multipathed propagation. I use this one too up in the mountains. You get a surface behind you that reflects RF energy pretty well and it will get your signal in. However, if there is more than 3 paths to the destination, the signal quality gets real bad and can ruin a QSO. My favorite medium is granite or iron composite rock :) Multipathing can make or break a QSO.

Hope this helps some! --Ryan

Not likely, unless you both live on mountain tops. :-)

: at this range? If not, what would be the best way to extend the
: range? I live in an apartment so any antenna will have to be small
: enough to set up on my patio or possibly in my vaulted ceiling.

If you can find a repeater located between the two of you, you
might be able to achieve your goal if you both have a fairly clear line
of sight to it. However, you'll almost definately want to do away with
the rubber duck (Or, as they are commonly known, rubber resistors. :-)
You can purchase cheap 5/8 wave 2M mag-mount antennas that can be mounted
on the nearest convenient air conditioner, metal table top, etc, that
will perform infinitely better than the duck.

The only way to find out is to try a variety of solutions and
pick the one that works best. That's what makes amateur radio so
much fun! :-)

I don't know if this has been fixed yet, but I've seen a couple
of different reviews in which the owners said the Index Lab rig had
a severe birdie problem - they appeared approximately every 20KHZ, as
a matter of fact. If you're considering getting one, you should also
check and see whether they have the keyer module working (the first
units shipped didn't have the keyer).

One goes out a window to a couple of ground rods and the other drops through
inside partitions to the cold water service pipe. They are differnt lengths
to (hopefully) provide a reasonably low impedance rf ground at most
frequencies.

This implies (as do other things I've read) that the problem is fixed by installing the TSU-8 tone decode module which presumably takes over the tone encoding function as well. Can anyone confirm this?

The TM-733a is the only radio I've found so far that has all of the features I want. If it didn't have this fatal flaw, or if the flaw was remedied by an option I'd probably buy anyway....

X-Posting-Agent: The Moderator's Assistant V1.0 (shareware edition)

I have owned a FT-900 for a week at this point. First impressions:

It solved a mobile mounting problem I had with the TS-50. The TS-50 had better rx sens out of ham bandsd. The FT-900's noise blanker is useless. Won't make a dent in the ignition noise, or power line noise. It does have an effect on a rhaspy 60hz noise from a neighbors touch lamp, tho minimal. But my car puts out a little noise ignition type. Maybe S-1 when I'm really "hauling" (Ford 4.6L V-8 in 1994 Cougar). The Yaesu Blanker has no effect on it. Called Yaesu, and they want me to send it in.

I am still a big booster of their radios, but this was a major disappointment. A one week old radio going back already.

Anyone else out there with a FT-900, and if so how's your noise blanker?

>enough to set up on my patio or possibly in my vaulted ceiling.

Two meters is a "line of sight" band. Normally, you must be able to
"see" the station you are talking to. With low power (as in from a
handheld), you also need to be close, or have very little attenuation
between you. The only way you will have reliable communications with
your friend 50 miles away, is to use a repeater that is high enough
that IT can "see" both of you. If you live in a mountainous area, a
mountaintop repeater would probably do the job, provided you used an
outdoor antenna, or at least a gain antenna. If you are in the
flatlands, you MAY not be able to do it, even WITH the repeater. To
use your terminology, "station to station with somebody that lives
about 50 miles away", implies direct communications, without a
repeater. Under normal circumstances, this would be impossible, and
at best, unreliable. What you are asking isn't even reliable on HF,
due to variable band conditions.

Maybe someone else will come up with a more creative answer.

Good luck and 73,
Gary

>>
>>Does anyone have any suggestions on providing the best ground possible
>>for HF when the shack is located on teh second floor?
>>

You can do just fine without a ground connection in this case. My station is on the 3rd floor with no ground connection, and I have no problems with 'RF in the shack' (running up to 700w on 160-10m). Do make sure that all of your equipment is grounded together, and don't use end-fed or indoor antennas. If you do have RF problems, a few 1/4 wave radials can help.
I do use an external ground to ground the antennas when not in use for lightning protection, but this is never connected to the equipment.

Woah! HRO sold me a TH-78 for $444 over a year ago. I have seen them
advertised recently for as little as $400.

My pricing strategy is to call at least half a dozen mail order places
to find the best price, then go to HRO and they will match it.

I'm looking for about 200-300 meters of multi-pair cable, preferrably
stranded, twisted pair, 8 to 12 pairs, with 16-20 gauge wire.

CHEAP is good, FREE is better. This is for an ambitious amateur radio telescope
project that is being funded out-of-pocket.

Hello, I am doing a telemetry project and I am curious if this will work.

We want to transmit a audio fsk digital signal to the ground. Now, on the ground can we just buy a regular 70 cm band receiver and will it spit the same digital audio tone out of the back, and then from there is it possible to use some sort of tone decoder or modem/tnc to then change the tones into a digital output which can then be feed into a computer I/O device.

I am looking for some information about if this design will work, and if so what are some specific products that we can buy and where can I get them.

Any Help Please.
Thanks, Bill

MR> Thanks

Your best bet is to find an open repeater in your area and use it.
2m HT's generally operate on a line-of-sight principle. If there are
no obstructions between the two stations it is possible to communicate
over about 200 miles with one watt and a rubber duck! (when ducting
is occurring)

Generally your HT is in need of a boost from a repeater for more than
5 mile communications.

Does anyone know how to modify the frequency display on an IC761.
The goal is to be able to directly read a VHF (2meters) frequency rather than
a 28MHz one in a 2M to 10M Transverter.
Also I'ld like to have the protocol infos that permits to drive the IC761
through its serial interface.

I use a counter-poise cut for the lowest frequency connected to the shield of the cable at the feedpoint of the antenna. Also wind some of the coax on Radio Shack type snap together RF chokes. This will help reduce feedline radiation tremendously.

Thank in advance to any that help!

Our local Civil Defense office is finally ready to cough up some $$ to replace our VHF transceiver that was stolen from the office.
We want a Kenwood TM-742, since several of us own them, they are rather easy to do the basics with, and the empty slot for future needs/wants.

The problem... every new price sheet seems to show the &*^#$% things getting closer to LIST price- rather than **our** price- So who has a good deal on new ones? Anyone else been shopping lately? We're not too proud to beg! And again this is for a club-station that is ARES/CD/RACES affiliated- so it's not going to a bad cause.

Tnx es 73

JJ> as?
Jeff I know nothing at all about Tejas so I will not comment on them. MFJ
makes some very good single band rigs and have heard no complaints so far on
them. I work at a amateur store and have sold quite a few of them. Heath is
no longer in the amateur business but there are still some HW-8s and 7s out
there for sell between 100 and 200 dollars. The HW-9 is almost impossible to
find at any price. The 7, 8 and 9s are my choice if for no other reason than
you have a choice of several bands in one rig. Hope this helps you a little.

Well out here in the "flatlands" we have people in downtown Chicago using repeaters 30-50 miles away and working hams in Rockford that are another 30-50 miles further away. So a reasonable repeater even in the flatlands can meet the requirements.

|>use your terminology, "station to station with somebody that lives
|>about 50 miles away", implies direct communications, without a
|>repeater. Under normal circumstances, this would be impossible, and
|>at best, unreliable. What you are asking isn't even reliable on HF,
|>due to variable band conditions.

Well that's a bit of an overstatement. Without a large investment, the installation of gain antennas and even modest elevation on the part of either station would make the distance feasible. Increase power to say 100 watts or so and the distance is very acheivable, but the additional cost can be pretty high in comparison to inexpensive 2 meter HTs.

As for HF, certainly ground wave on the lower 2 bands ought to allow reliable communications at 50 miles.

My recommendation is for each of you to figure out the highest possible point at your locations that you can place an antenna. Then build/buy/borrow whatever an antenna with at least 10 dBi of gain. There are plans in the ARRL Antenna Book for a simple 4 element quad that should give close to that. Double the length and the number of elements and you ought to be able to increase the gain another couple of dB. Install good coax, i.e. not RG-58, but at least RG-8 or RG-8 foam.

Try it, you don't have a lot to lose. I regularly work guys out 50-100 miles with my 14 element circularly polarized OSCAR antenna only 20 feet up. Maybe you wont have 100% reliability, but I suspect you'll have fun trying it. 2 meters is a funny band. Although in theory it is line-of-sight, in practice you often can work quite a ways beyond the visual horizon. Early morning and evening times often produce modest signal enhancements that can help you reach quite a bit further than expected. You'll also learn a lot about propagation, antenna building if you should decide to give that a try, and have fun at the same time!

4083. DuckTail antenna counterpoise

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-08 00:32:45 UTC
From: beau@enterprise.america.com
Message-ID: <34lm3d$56b@enterprise.america.com>
Source record: 224410

I recently tried my own version of the DuckTail HT antenna enhancer
advertized in CQ and 73. I connected a 19.25" piece of flexible wire
to a large round crimp stule connector. After hooking it up, I noticed
very little difference in receive or transmit.

The sales article boast that the DuckTail is the missing part of the HT
antenna system (2M). The article reported significant gains...abt 2-4 db
when installed.

Thinking that I may have missed the elusive secret in the miracle design
of the DuckTail...1/4 wave counterpoise....I purchased the advertised unit.
Upon trying the purchased unit out, I noticed no significant difference
in the transmitted or received signal when compared to my duck (dualband type
for Alinco DJ580).

My only thought is that the metal consrtuction of the Alinco case must
somehow be a significant counterpoise....mabe the one used in the the article
had a composite or plastic case. Anyway, my homebrew version was justs as
"innefective" as the commercial unit.

Has anyone here had any differentr experiences with the DuckTail system?

Hi-

The best way I found was to use flat wire braid with as many strands as possible. I had to go to a specialty electric store to get it but it was sure worth the trip.

It's essentially the braided outer conductor from some RG-8 cable, stomped flat.

Remember skin effect, where RF travels along the skin of a conductor? You want to present a low resistance to the RF current so it will bleed off to ground....and the individual strands in the braid have LOTSA skin.

It works much better than one single cable, regardless of that cable's diameter.

The stock ducks will not make the trip. Ok, the stock HT on an omnidirectional outdoor antenna probablly won't either. I would investigate the use of a local repeater and/or small yagi antennas with power amplifiers.

I know, not what you want to hear, but I am looking at a similar situatuation - a 60-70 mile trip on 2m - but I can put up an outdoor yagi at about 40 feet on each end. Not sure about the power level I'll need yet, but I have the fall to worry about it. I also have the option of gettin the long distance contact via a local repeater on top of a 27 story building. I can always hear the repeater (35 watts out) on an HT with a 5/8 mag mount, so I know the yagi will get me in on the far end.

The other option is 2m SSB with outdoor antenna. Might be rough in your appartment. (Have you asked to put up an antenna? just a thought)

I can now say that this is *not* the fix. Kenwood has finally
released an official Service Bulletin on the PL distortion problem,
and the solution is to replace several discrete resistors with more
carefully chosen values. The TSU-8, and even the resistor network DAC
is not involved. They claim the distortion goes from 9% to 4%, and
the folks that have had the fix performed says that it is no longer
noticible. I haven't sent mine in yet.

I posted a summary of the Service Bulletin some time ago, but it may
not have had the right distribution. I'm attaching a copy of it below
this article.

Happy Hacking!

Kenwood Service Bulletin #ASB-1060 2 Pages
Subject: TM-733A PL Tone Distortion August 30, 1994

Symptom:

Transmitted PL tones at the receiving station have a relatively high level of distortion. This is easily seen when the incoming signal is viewed on an oscilliscope.

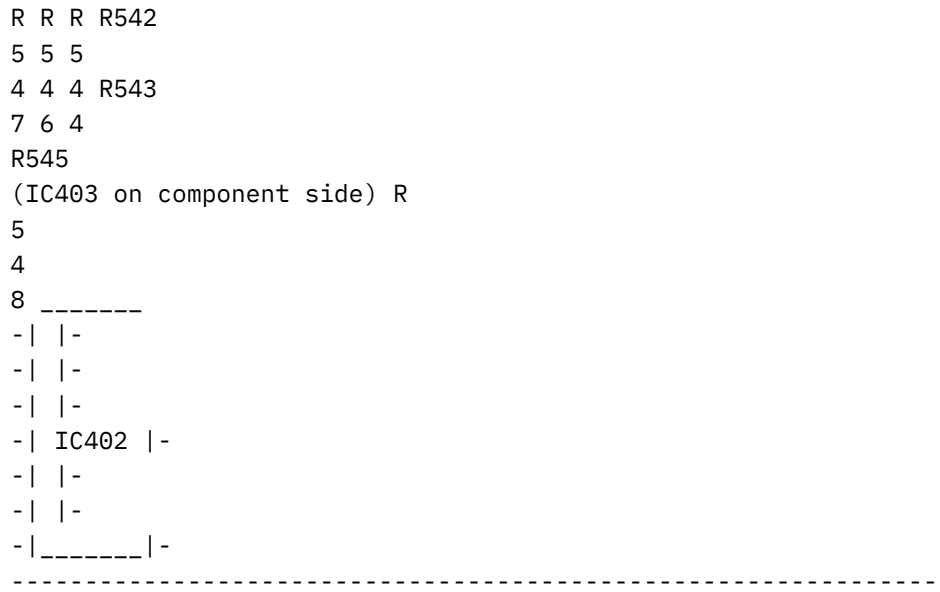
Countermeasure:

Cange the value of the "Pull-up" resistors in the PL tone encoder circuit as shown in the accompanying chart and illustration. This reduces the distortion from around 9% to approximately 4%.

Part	OLD value	NEW value
R542	1.8k	2.7k
R543	1.8k	3.3k
R544	1.8k	4.7k
R545	1.8k	6.8k
R546	1.8k	10k
R547	1.8k	10k
R548	1.8k	10k

Procedure:
----
1. Disconnect the power cable, microphone and antenna's, etc.
2. Detach the front panel and set it aside.
3. Remove the top and bottom covers.
4. Remove the speaker and speaker mounting bracket.
5. Disengage the plastic front panel from the main chassis.
6. Carefully disconnect the two ribbon cables from the Tx/Rx unit C/4.
7. Remove the two Phillips head screws that secure the Tx/Rx unit to the chassis.
8. Turn the circuit board over and replace the resistors using the parts list and illustration as a guide.
9. Reverse steps 1-7 for reassembly.

TX-RX Unit (X57-4360-00) Foil Side View



Caution: This modification requires advanced surface mount soldering equipment that is rated for CMOS circuits. It also requires familiarity with advanced surface mount soldering techniques. If you do not have the proper equipment or knowledge do not attempt this modification yourself. Seek qualified assistance from your closest Kenwood Service Center (Long Beach, CA, or Virginia Beach, VA).

Yeah I have found this to be the case. Once you have your radio modified
you can unmodify it at will and then remodify it just by turning it on
while you hold down the two arrow keys. Of course its not that handy a
feature considering you lose all your memories. (believe me i know!)

Out of curiosity, how common is/was the interest in exotic LONG RANGE communications the reason amateur radio operators got involved in the hobby. I know that, as a kid, I was always intrigued by hearing guys talk about a contact with someone in, say, Spain.
If people often jump in for this reason, they need to really understand the limits of the bands available to them under the no-code license, if that's their starting point. I'd hate to see people leave the hobby without upgrading because they got discouraged at not being able to immediately DX.

Well, I want to do other things than communicate with this particular person I mentioned at first. I am just going to start with the no-code but as soon as I can I want to get the 5wpm CW as well so I can do more.

From the news and email responses I have gotten, it doesn't look good for 2m HT in my situation. I would rather not have to use repeaters since I hate to wast valuable repeater time on idle chatter with a friend with whom I will want to talk at length with.

That being said, the reason I am trying to figure this all out is that we would rather not waste too much money on equipment which won't do the job we want. A good 2m HT is a good investment anyway but there is no point in putting a lot of money in other 2m equipment if it won't do what I want. So, using just the privileges available with a Technician license, what would people recommend to communicate without repeaters at a distance of 50 or 60 miles? If I upgraded to Novice as well (adding element 1A) so that I can get 10 meter etc. what would be the best band to use? Keep in mind that the antenna must be portable (fit on a balcony and easily taken down and stored). I also don't have a lot of money to invest.

I do appreciate all the comments and suggestions. I'm learning alot which is of course one of the things that makes ham radio so much fun!

thanks,
miker@msai.com or miker@mercury.interpath.net

I had a similar problem with one digit on my frequency display and called TenTec tech support. They suggested that I open up my Corsair II and remove the frequency display board and clean the contacts where it plugs into the PC board it is mounted on. It wasn't too hard to do and seems to have cured my problems at least for the time.

Good luck and 73 - John, W3GOI

If I were in your shoes, I think I'd do two things:

First, I think I would assume that a 2M HT is not going to give you usable, reliable communication over a 50 mile distance (unless, as has been pointed out, your particular geography is quite unusual). So if you're going to get something working at all on 2m, you'll need something more like a 50W mobile unit powered off a 12V supply (e.g., one of the Astrons), feeding a beam. Fortunately, 2M antennas do not have to be all that large. Browsing the Ham Radio Outlet catelog, I see, e.g., that a 4 element Cushcraft 124WB yagi (chosen at random, not as a particular recommendation) is only 3 lbs, and only 4 ft long, surely within your requirements.

This still might or might not work. You'd probably just have to try it. The comments that 2M is more-or-less line-of-sight are correct, but as with many things, it can be more complicated than that. There's a lot of scatter also that may give you a path even if line-of-sight isn't possible.

Anyway, this brings me to my second suggestion: see if you can find some local hams near you and your friend who can try the path for you with equipment that seems roughly similar to what you'd consider buying. This shouldn't be hard. EVERYONE these days seems to have 2M gear. If you don't know any local hams, call the ARRL and ask for a list of local clubs; go and meet people there. At most club meetings, you're invited to stand up and give any announcements you like and so certainly, you could explain what you're trying to do and ask for some help. Actually, I suppose you might even find out by experimentation this way that 2M HT's WILL work in your location! Who knows? But you should be able to get some free help to try things out, this way.

Other random commments: Don't worry about clogging a repeater with idle chatter. Unless the hams in your area are a whole lot different than everywhere else in the world, that's most of what you'll hear on most repeaters most of the time anyway. Your chatter can't be that much more idle than everyone else's, I'd guess. :-) Just be sensitive (as you should be anyway) to give other folks a chance to get in and to stay off the repeater if you hear a net come on (unless you're participating) or if there is some priority traffic.

Regardless of whether a 2M HT is going to make the 50 mi path to another HT, you may want one anyway. Most hams can't resist these "toys". They're a lot of fun and that's a lot of what a hobby should be about. So worst case might be that you each buy the HT's, you discover you do have to go via the repeater (okay, you can do that) but you decide (especially after getting them) that they're a lot of fun for talking with a lot of

other hams also.

> Soon to be Tech Plus Licensee

FOR BEST LIFE, NICADS NEED TO DISCHARGE DOWN TO 1 VOLT PER CELL. THE BETTER CHARGING METHODS ARE 1/10 OF THE CAPACITY FOR 15 HOURS OR THERE ARE SPECIAL NICAD CHIPS WHICH USE SIMPLE COMPONENTS WHICH CHARGE TILL THE CELLS REACH THEIR PEAK VOLTAGE AND THEN DIP SLIGHTLY. THERE WAS AN ARTICAL ON THESE IN ONE OF THE RECENT HAM RADIO MAGAZINES.

Hi, Mike. 10 meters would NOT do it. When 10 is open, you can talk
thousands of miles. But 50 miles is in the "skip-zone," that's the
area "skipped" by your signal as it bounces off the ionosphere and returns
to earth. With a bit of power and a big antenna, you might be able to
go 50 miles via "ground-wave," but that equipment is outside your criteria.

In face, in my experience, you're asking what major communications companies
have been asking for years: how to send a signal about 50 miles with
little antenna and little money. They haven't found an answer.

Probably the best amateur bands for that would be 6 meters or 2 meters,
and the best mode would be SSB (or CW). Assuming there isn't a big piece
of earth between you (ridge, mountain), you could do it with about 100
watts and a 10 element (5 element on 6 meters) beam up 30 or 40 feet.
Maybe even a little less.

Or, since you have a computer, you could try packet. Maybe there is a
"keyboard to keyboard" link between you. It's a little slower, but would
do wonders for your typing speed. And mostly wouldn't be in anybody's way.

Good luck, 73

4105. Re: 50 mile simplex suggestions

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-08 18:29:47 UTC
From: phb@syseng1.melpar.esys.com
Message-ID: <phb.779048987@melpar>
Source record: 224432

About a year ago, I ran a bunch of tests with friends and via random QSOs on 2-meter FM. Using a Yaesu FT-2400 (50 watts) and a homebrew 5/8 ground plane in the attic (approx. 18' AGL to the attic floor) I was able to consistently work other 50-watt stations out to around 50 miles; most were using either Isopoles or some model of commercially-available vertical (Cushcraft Ringo Ranger, etc.).

Using the same setup, I made 44 FM simplex QSOs in 6 grid squares during the September VHF QSO party. For the January contest I switched to a vertically-polarized, 4-element yagi at 15' and had 65 QSOs in 8 grid squares.

For the record, my location is in northern VA, about 45 miles west of DC. Many of the 40-50 miles QSOs were to places like Silver Spring, Bethesda, etc.

After switching to SSB, I developed a set of graphs based on VHF propagation info from the old VHF Manual, plus did a lot of "station capability" calculations. Since there are several factors involved which are all important (power, receiver sensitivity, bandwidth, antenna gain & height, etc.) I'd be glad to draft a short tutorial and make it availble to anyone who's interested. It will probably require a SASE, since I can't very well e-mail the graphs.

The long and short of it is that the first 75 miles of the path loss curve is quite steep; in other words, large changes are necessary for small distance improvements. Between 100 and 250 miles the curve flattens dramtically, which means that only small additional improvements are necessary to extend the range conside-rabely. So, it takes a bit of doing to develop a decent basic capability, but after that incremental upgrades can make a big difference.

BTW, I tried up to 80 watts FM and up to a 10-element yagi to communicate with a friend using a 2.5-watt HT 32 miles away (he had a 1/4-wave GP on his roof). While he could hear me decently enough to copy, he was "nil heard" at my location (and I had a >1 dB preamp and the antenna at 30'). Based on that, you will probably need 30-watt amps at both ends, plus 4-element yagis, to cover your 50-mile path.

73,

Paul, K4MSG

Well I used to top mine off everytime I used them and after a year
or so they had very little left in them. So I discharged them down
to almost zero and then charged them up again and what do you know -
they were back to almost normal capacity. So you've got to discharge tehm
deeply, at least occassionally. I don't know if you should do it often
or not, but that's my story.

SETIQuest is a new quarterly print/electronic mail (E-mail)
periodical containing news, technical information, and tutorials
devoted to bioastronomy and its subset, SETI (Search for
Extraterrestrial Intelligence).

SETIQuest is published for professionals, serious amateur
astronomers, and individuals curious about this fascinating field of
observation. SETIQuest fills the need for a specialized astronomical
publication devoted exclusively to the on-going search for evidence
of life in the Universe. Such evidence could be intentional or
inadvertent signals of other civilizations. Such evidence could be
found in spectral signatures of biological activity on extrasolar
planets or in the interstellar medium.

SETIQuest is written and edited for the scientifically literate
individual taking part in the progress of our technological
civilization, with articles by amateur and professional scientists.
SETIQuest includes information about hands-on observational programs
that can be carried out by individuals and groups of amateur
astronomers at radio and optical wavelengths.

SETIQuest is filled with articles covering topics such as:

* Tutorials about bioastronomy and SETI
* Microwave or optical SETI as practiced by amateurs
* "Do-it-yourself" participation in bioastronomy and SETI activities
* Book reviews
* Regular commentary on issues relevant to SETI and bioastronomy:

SETI and the political milieu

Philosophical issues regarding the prospects of success and
failure in the search

SETI as a parable of science versus pseudo science

Publications Watch: Summaries of recent scientific/general
publications relevant to SETI

For your FREE issue of SETIQuest (Volume 1, Number 1), send us

4111. 2m HT usefulness in the Sierras

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-09 00:39:33 UTC
From: dfoster@worf.qntm.com
Message-ID: <34oas5$orc@worf.qntm.com>
Source record: 224438

Hi! I'm new to the net AND amateur radio, so please forgive my ignorance.
I've got a question similar to a thread recently circulating. I would like
to use a 2m HT for emergency communication while backpacking and skiing in
the Sierra Mountains of California. So my questions to hams with experience
in this region is: what is the probability of connecting with a repeater in
this situation? Must I be at the top of the highest peak, or are there enough
repeaters on nearby mountain tops to receive my signal out of Valleys? I spend
most of my time in the following areas: Tuolumne meadows of Yosemite, Emigration
Wilderness, Desolation Wilderness and sometimes Hoover Wilderness. I have a repeater
directory, but that
lists only the NEAREST CITY!

thanks for the help!

I saw the Alinco 6m FM unit at the ARRL SW conference. It has two
power settings, 1w and 10w. The radio is of the mobile type and slightly
smaller than this years average mobil radio. The tech rep said that Alinco
was thinking of asking 400 - 450.00 dollars.

Take a better antenna with you. If you have to bounce off a cliff or two, it can make all the difference in the world. Use at least a 1/2 wave whip, or preferably a roll-up J-pole you can toss up in a tree.

Be carful how far you bring them down, you may go past the point of being able
to bring them back. One volt for each nicad cell is a good rule of thumb to
determin when to start recharging them.

4117. Spectrum Analyzer

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-09 14:53:18 UTC
From: gahimer@NeXTwork.Rose-Hulman.Edu
Message-ID: <34pssu$i49@master.cs.rose-hulman.edu>
Source record: 224299

I have a spectrum analyzer that has been superceeded by newer Eq.
that we no longer need. It is an HP 8551B w/ 851B display unit. Thats
the scope attached as a seperate unit to the top. Frequency range is
01 to 42 GHZ !! Thats right 42 GHZ.

I would like to see this go th some HAM who is doing microwave
work in Amateur Radio. Yes, I know hams will take anything, but I also
have seen most Eq. set in the back of the garage and collect dust. So
don't respond to this if you don't have an actual need!

I will not ship at our expense, this thing weighs @ 60-80 #.

Email me if you are interested.

The Ham Radio Outlet is located in Woodbine VA. It has a lot of equipment and decent prices. However, you will need an automobile to drive down there.
Just take 95S and take the Woodbine exit, it is about a 1 mile from the exit.

There is also Maryland Radio Center in Laurel MD which is really closer to D.C. than Woodbine VA. They have competitive prices on ICOM and Kenwood. However,they don't carry a lot of the items in stock but order them. They have a fair amount of equipment available but not nearly as much as HRO. They
do have antennas, mounts, etc.

>Maybe even a little less.

Good idea here, but in connecticut we routinely make 50-70 mile qso's via
6 meter FM with mobile and base rigs at about 50 watts. A good qth is
a big factor, but if you have relatively open terrain, 6M will give you
very reliable contacts. These mid-distance (VHF-wise) contacts seem to
be uneffected by propagation fluxuations (E-skip and tropo) except for the
racket on 52.525 when the band opens!!

Look for converted Motorola's for low $$$ and get a pair on the
same freq, such as 52.525, and you should be in business.

> JJ> to connect fairly regularly, any thoughts on small traveling anten
> JJ> as?

Look around for a ten tec argo 509, it should be about $300 and is
a standout QRP rig. 5 band, cw and ssb, hears well and has a great
on-air sound. 5w on cw and 2w pep on ssb, you may not be busting
pileups but hey, whatta rig!

The nice thing with the argo is that outside of a mini backpack
single-band qrp cw rig, it may be the last qrp rig you ever need.

for single band rigs look at oak hills research, and especially KANGA-US.
The catalog alone is enough to get one on qrp!

73 and good luck

Source record: 224364
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

A friend of mine has an Icom 551D 6m multimode with the FM, IF shift
and VOX modules, 80 watts output. AES lists a price of about $500,
but he's wondering what he can really get for it. I've seen (and worked)
the radio, it's in IMMACULATE condition.

So what's it worth? He hasn't decided if he'll sell yet, but a good offer
might tip the scales.

Post it for all,
Galen, KF0YJ

I am thinking of getting the new GAP 80-10 vertical. On paper it looks great and the price is much better than the R7. I would like to hear from any and all users of the GAP antennas and see what everyone thinks of them. I would hate to make a real big mistake by getting this and finding out that everyone but the reviewers hate the antenna.

Dave: I do a lot of hiking in the sierras and never had problems hitting hams
(some as far as Las Vegas). I use a Yaesu FT11 with an AEA 1/2 wave antenna
(I think is called the Hot Rod) and with only 1.5 watts!. The trick is to be
at a high elevation with no trees around you. I also notice that near granite
walls (plenty in the Sierras) your TX and RX are even better (I think granite
is a very good reflector(?) of RF and acts as a giant dish antenna).

I have also contacted people on simplex as far as Fresno (CA) from Kings
Canyon NP (about 80 miles away!). Again you have to be in the right spot.
Near Yosemite you can hit the 147.000 repeater which is linked with 147.030
down in the San Joaquin Valley.

Happy hiking and hamming!

The problem of grounding you describe is also common to many Field Day operations. The solution is in providing an RF ground for your equipment. To do this you need to run a quarter wave wire for each band you want to operate on. Each wire should have one end connected to the ground point on your rig. Not providing an RF ground will often cause your SWR readings to be high and many auto antenna tuners will have difficulty achieving a proper match. You also can have RF getting into mike cords and notice small shocks when touching metal portions of your rig or equipment. The DC or power ground is a different subject and is safety oriented. That should be provided through your 3 terminal line plug. If you have to make a separate "DC" ground then you may want to decouple the RF from that line with Large Ferrites or an inductor that prevents RF from flowing in that path. The 80M quarter wave line will be a problem for most rooms as it is difficult to run that around the room. This one if you need it may have to exit the shack and run on an outside wall. Keep in mind that while these quarter wave lines will create an RF ground at your rig, the other end of these lines is 90 degrees out of phase and will be a voltage maximum. (you can get a good shock if you are running high power) Make sure the wire is insulated and that you do not have an exposed end. You will likely get a number of inputs and I offer these suggestions as they worked for my 2nd story shack and every year on field day we face exactly the same problem. Quarter wave radials always fixes the problem! Hope these suggestions help.

> The Maryland Radio Center in Laurel MD which is a little bit closer to
> D.C. than Woodbridge, VA, but not much. I found it once.

My favorite place is the Electronic Equipment Bank in Vienna, Va. Take RTE 123 south from Tyson's Corner to Vienna (about 3 miles) and turn right on Mill St. EEB is located on the right in a green cinderblock warehouse of a building with antennas on the roof. You can twist the knobs and listen to most of their in-stock Yaesu, Kenwood and ICOM ham stuff, and, as a bonus, their extensive line of SWL receivers. This is probably the closest ham store to D.C.

Good luck, and good shopping!

I used to use one in the mid to late '80s. Worked fine for me. Just
be aware that you have to use the built-in packet terminal software
with the PK-64 (you won't be able to use your favorite C64 terminal
software). Also, if you want to leave the PK-64 up (for digipeating),
you'll have to leave on the C64. And there's no built-in maildrop.

>lists only the NEAREST CITY!

I don't know about those areas but between Shasta and Susanville there are
only about 3 repeaters and I could hit one or two of them less than half the
trip using 50 watts and a 5/8 wave vertical. Just ain't no hams around them
parts. Lots of truckers though. I suggest a CB. Nowadays I always take
a CB along when traveling the desolate stretches out West. Codeless or
Godless or whatever, there are probably more bears and cougars than hams
in them parts.

For Sale:

HP95LX [1-MB version] DOS-compatible palmtop computer/personal organizer. Includes all standard software (i.e. Lotus 1-2-3, Appointment Book, Phone Book, etc.), all instruction manuals originally shipped with the computer, the book "How to use your 95LX" by Monday/Robinson, and a few cables (useful to connect your palmtop to a PC or workstation) and an installed and licensed copy of "95Buddy", the enhancement software for the palmtop. Ideal for portable Packet Radio station.

Price: $200.00

Telebit QBlazer Modem. Battery operated or AC Power (both included). Has all cables to connect to HP95LX above. Original packaging included, as is original instruction manuals. Good tiny modem for a laptop, too.

Price: $75.00

If Sold Together: $250.00

Payable by cash, cashiers' check or money order. If by check, I would like ten days for it to clear (or sooner, if it clears more rapidly).

Message-ID: <1994Sep9.194619.456@stim.stim.tec.tn.us>
Source record: 224362

What happened to the "Used Amateur Equipment Prices" that was posted back several months ago? The summary gave the traded prices for equipment sold at hamfests, flea markets, and over the 'net for the previous several weeks.

I've looked through several of the rec.radio.* postings from end-to-end over the last two or three weeks and haven't run across the list. Has that service ceased or is it still available at some site?

I thought it was a great idea 'cause it gave a fairly good idea of the prevailing market value for used amateur gear.

Charles, W4BIV EMail to ceddlemon@stim.tec.tn.us

or post if you think your reply would be of general interest to the 'net.

>Does anyone know of any way to connect two 2m transcivers to 1 antenna
>with both monitering and only 1 transmitting at a time. Without the use
>of an antenna switch in reverse.

Depends on the radios. If you can get to the antenna switching in the
radios, and can modify them, yes.

Lets try some character graphics:

```
NC
v-------to diagram below
ant --------------x-----
NO to TX of 1st radio (unchanged)
^-----
Ant relay in 1st radio
```

```
NC
v-------to diagram below
from above--------x-----
NO to TX of 2nd radio (unchanged)
^-----
Ant relay in 2nd radio
```

```
+---- rx 1
from rx side of 2nd radio-----preamp/splitter-+
+---- rx 2
```

Note that if the RX preformance the preamp may not be needed and a
simple resistive devider can be used... All you are trying to do is
maintain the impedance match. Both RX should have some TX protection on
their front ends. I used this system cascaded to 3 VHF radios on one
disguise antenna in a surveliance vehicle back in the 60s - a scanner,
a VHF police radio and a VHF mobile phone.

Let me know if it does the trick for you.

> finding out that everyone but the reviewers hate the antenna.

I've got one and it's great for my situation, ie. postage-stamp sized
back yard. Can't compare it to an R7 because I've never had one here,
but I did compare it to my old Hy-Gain 18-AVT vertical... like day and
night!

If you have a small lot and can't even string up wire antennas due to
lack of trees, go for the GAP. You won't be making a mistake.
One thing though, get some good quality rope to guy it. It'll dance
around in heavy winds but if properly guyed (I've got three ropes) then
it won't bend at all.

Source record: 224297

Someone lumped the HW-7 and HW-8 together--ignore that. While it is true that they are both direct conversion receivers, the HW-8 is several steps above the HW-7 in receiver performance and cured a lot of the troubles that the '7 had. I have three of the HW-7s, and one will never be modified so I can demonstrate how badly they sound. They aren't too bad if you rip out the MOSFET mixer and replace with a double balanced mixer, such as the MCL SBL-1 or SRA-1. The HW-8s are still enjoying a good market, prices from $50 (very rarely) to $100 (once the "going" rate) and inching up from there..although I wouldn't pay anything over a hundred regardless of condition, myself.

My current favorite is the New England QRP Clubs NE4040, which was a club kit offering for $40. It uses some NE602s in a minimalist superhet configuration with crystal filter (only two crystals, for simplicity), varactor tuning (simplicity and low cost). I don't have mine in a cabinet yet but just listening on the bands with a 40 meter loop which is mostly on the ground it sounds very good, especially considering the minimal component count. (QSK, electronic T/R switching, no sidetone--the receiver monitors the transmitter signal.) After the kits sold out, NN1G started selling them himself (He's the designer), and Dave told me he has an upcoming QST article on it. Really neat rig. (Disclaimer: I am not obligated to Dave in any way, unless I owe him something for taking over as Technical Editor of the QRP Quarterly when I couldn't do it anymore, and have no interest in the success or failure of this item on the market. Really neat little rig, though, especially at the price.)

A friend of mine is now on his third HTX-202. First one the finals went, second one it locked up with an error message on the display (PLL problem apparently). The one he is using now has an audio problem (receive audio from the speaker..... that'll probably be taken back soon.

Each time he brought the radio back it was after a very short time and both times the RS employee on "duty" would pack it up and proceed to fill out a repair order slip, to ship it out and make him wait for it to be fixed. This is with a radio that he had just purchased a few days earlier.

After some discussion with the manager, he was given a new radio on the spot. This should have been done in the first place.

4155. Impressions of Radio Shack DSP unit?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-11 00:19:49 UTC
From: bad1679@ultb.isc.rit.edu
Message-ID: <1994Sep11.001949.6966@ultb.isc.rit.edu>
Source record: 224379

Hi,

I would like to try out the Radio Shack DSP filter (mostly because it is much cheaper than any other I have seen on the market) to improve my HF mobile setup by cleaning up nasty alternator hash that I haven't been able to clean up by conventional means. Is anyone using this filter? Is it any good? How does it compare to more expensive ones like the Timewave (especially when it comes to cleaning up mobile noise)?

Thanks for your input.

```
I am considering the purchase of an RF Concepts 2m/440 Amp
(2/70 or 2/70G). The G model has a built in preamp.
It will be used for my Yaesu FT-530 HT in the car and at home.
The car has a 1/4 wave 2m & 440 Mag Mount and there is a
Diamond X50A dual band on the roof at home (30-35 ft up).

o Does anyone have any experience with this amp?

o Must I feed it 5 watts, what if I give it 2 or 3?

o I read somewhere that due to intermod on HTs you shouldn't use
preamps, is this true?

TIA & 73s
Steve (waiting for his ticket impatiently :-( )

Source record: 224387

I konw that a few weeks back there was some discussion of the relative merits of the various DSP products on this Group - but at the time I wasn't really "in the market" so I ignored the thread. Now it seems that I've bought in to the DSP concept so would appreciate any advice or recommendations regarding DSP units other than the Tandy model. From what I read in the ads (a great source of unbiased and trust worthy info :)) I '"think" that I'm leaning toward the Timewave model (the DSP 59+). I am also intrigued by the ad hype for the new MFJ Model 784. As a matter of fact I tried to purchase one but was never able to find a dealer with any in stock. In this regard, I seem to remember seeing a post from a purchaser of the MFJ unit (purchased it at an Ala Hamfest if I recall correctly) and would really appreciate a first hand assessment from him or any other lucky (or not so lucky) purchaser of the MFJ (or any other) DSP products.
Thanks and 73s

Bill -

I entered a similar query to Internet, FIDOnet and the packet network.
Received three replies:
One reply was from a Ham looking for similar info.
One reply was from a Ham who thought all MFJ products were
substandard.
THe third reply was from a Timewave vendor.

Later, I happened to get a call from an acquaintence who had a
TImewave 59+. He is very happy with it.

My calls to several local and national Ham stores resulted in some
chuckles from the salespeople. Apparently the MFJ unit has not
received wide distribution (to say the least).

I use several MFJ products (no DSP unit yet), and have found them
adequate but not impressive.

Let me know if you find anything!

>73,
>Todd
>N9MWB

Your suggestion is an excellent one, especially for a new ham. I once used a setup similar to what you suggest, although I built an 11-element beam out of old TV antenna parts and put it on a manually rotated mast. The who thing probably cost about 20 bucks, and most of that was in the coax needed to get the signal up to the antenna. With it, I was able to talk reliably to other hams 30 to 50 miles away in the flatlands of Jacksonville, Florida, provided they had an antenna with some gain and direction. I was also able to hit repeaters in downtown Jacksonville (about 20 miles from my house at the time) using a Yeasu FT-208 at low power.

The reason I suggest it's an especially good idea for a new ham is that there are few things that are as easy to accomplish, and so rewarding, as building a good antenna from readily-available parts. It's the sort of thing that can instill a love of ham radio into new hams, and in the process build a hobby that will last a lifetime.

Incidentally, building a 2M beam isn't hard, and needn't cost much, and it IS fun.

4172. Problems with Kenwood TH-78A Modifications

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-12 03:52:58 UTC
From: reykowsk@eemips.tamu.edu
Message-ID: <350jaq$7sm@news.tamu.edu>
Source record: 224395
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Hi All,
I just bought a new TH-78A and tried to do the "Crossband Repeater" and
"Beyond Caps/Mars Modifications".
After trying different diode/wire configurations I ended up with:
D3,D4, and W2 removed.
Now I can
RX 50-180MHz, TX 136-180MHz, (VHF)
RX 300-400MHz (VHF)
RX 400-512MHz, TX 40-512MHZ (UHF)
But still, I can not receive from 800 to 950 MHz.
Is this feature not available anymore? Can anybody verify this?

I also tried earlier suggested modifications like
D3,D4 and W1 removed, and
D4,D5 removed
both gave me only extended receive with no extended transmit.

Another curiosity: My manual describes the crossband repeater function
for the standard configuration (No diode/wire removed).

A second question: Can someone verify whether the only difference between
a TH-78A (American version) and TH-78E (European version) is that in the
"E" version D2 is removed? Do I need an extra tone module for 1750Hz in
order to get into European repeaters or is this a done deal after removing
D2?

Thanks a lot in advance,

Arne

From: carreiro@netcom.com
Message-ID: <carreiroCw07Et.84@netcom.com>
Source record: 224298

I too have had trouble finding the MFJ unit. For now, I've given up trying to find one and will hold off in purchasing a DSP unit till we hear more pro/con opinions of it.

I have had one question that I have been pondering that I'd like to add to Bill's original query...

Since DSP units are obviously digital devices, do they themselves generate noise that the receiver picks up? Obviously the filter would reduce its own noise output to the speaker. I guess my question is more in the effect that the reciever would see in reduced selectivity or sensitivity from picked up digital noise from the DSP units.

I suppose it would be easy to determine by not connecting the DSP unit to the audio output, and toggle it on and off for comparison; or by using the bypass switch on the DSP unit. Has anyone performed a test like this or have related data??

I'd like to see this type of test added to any comprehensive comparison test between DSP filter units. ARRL, you listening??

Thanks

I am a missionary kid and am interested in getting into Ham Radio for the purpose of communicating with Missionaries and other development workers around the world. Most of you probably know how poor communications are in Third World countries. I do not yet have a Ham license, but am working on it.

If there is anybody out there who has equipment that you are not using that you would like to donate or sell very cheaply to me to get started, I would be very appreciative. My brother is doing packet type stuff in Africa so I'm guessing I'll try to get into that as well. I don't yet know what all I need, but guess it will involve radios, antennas, and TNCs.

If you've got some equipment or know of anybody else who does who would be interested in helping out, please reply directly to me (Larry Fountain) at:

U21604@uicvm.uic.edu

Thanks for any help you can offer :)

Have 2 ea. H.P. Model 35470-00100 2GB 4mm Tape drives
for sale. Both are in new condition and interface over standard
SCSI interface.

Most of the windows based backup programs support these drives.
Asking price $575 ea. Will ship from CA. COD anywhere in US.

Also have 4mm backup tapes, recorded once from the factory.
$4.00 ea. in NEW condition.

Thank you! For more information contact Jeff Hilliard
at (916) 791-7600 or drop me a note at jhillird@ix.netcom.com.

>Good Luck
>Avery

I have had one for about nine months now. I am very pleased with it.
It is a great buy, AMEN on the extended warranty. It is a great buy!
Purchase a second battery. The only "problem" that I have with it is that
the main oscillator is too "loud." If you are tuned to 146.94 and are
near another rig, (a few feet) you will break the squelch on the other rig
if yours is turned on in receive mode! Apparently the transmit frequency
oscillator runs all the time and just the final amps are activated in
transmit mode. It needs better isolation from the antenna.

I purchased a used Heath HW-2036 synthesized
2-meter transceiver a few days ago. For
several days it worked very well. Last night
the sync lock light came on permanently.

Does anyone have any experience with this
problem and know what the fix might be
for it? I don't yet have a manual or
schematic to troubleshoot the rig.

Thanks,

Harold

> "E" version D2 is removed? Do I need an extra tone module for 1750Hz in
> order to get into European repeaters or is this a done deal after removing
> D2?

There are two parts to this question, 1) the presence of 1750Hz and
2) the suitability of a TH78A for use in Europe. As to whether 1750
is or is not present in the TH-78A, I suggest that you just press F-tone,
rotate the tuning control and see for yourself whether 1750 comes up
between 250.3, the highest PL and 67.0 the lowest.

There is another difference between the 78A and 78E and that is the key
layout. In the 78E the small button between PTT and MONI is the TONE, and
this allow access to tone burst even with the keypad closed or soft cover
on. In the TH-78A that button is CALL. This makes the 78A difficult to use
alone with a tone burst repeater. The solution is to get a speaker-mike
with function keys and then you can program a mike key to be TONE.

Thank you to everyone that helped me out with the mods for this unit. I have come across another snag though. In trying to remove the cover from the unit, I have found the one of the previous owners stripped the two screws that are on the back (bottom left of clip, upper right of clip.) Does anyone have any hints on how I can get those darn screws off and replace them with some good ones? I have noticed that all the screws in the unit (black ones that it) are of soft quality.

Thank you,

Jerad

directory, but that
>lists only the NEAREST CITY!

Saw some sugeestions that you bring a 1/2 wave antenna or a roll up J-pole to help you "get out". You might consider a collapsing beam. A company I used to work for made spring loaded, folding yagis for wildlife telemetry and direction finding and they work great. Easy to build. A good design would not require assembly/disassembly - the elements can fold up. A two meter, hand-held yagi (three element) can fold to about two feet long and strap to the side of your pack.

I'm not saying that a beam is a better idea than the others. But you may find it well suited for your needs.

Also... to locate a repeater use the VFO scanning function on your radio (if you have that feature). I've done this on ski trip and can almost always find someone talking somewhere. Just program the upper and lower scan limits for one of the repeater sub bands.

Take care.

Source record: 224311

I just purchased the above radio, no antenna or anything else, at an auction for $14. I haven't tried it out, but had it tested at a local shop and was told it had "birdies" and a few other problems. Rough estimate to repair was about $150. Is is worth it? What is a 2 meter rig like this worth in good shape?
I am iterested in amateur radio, but have neither equipment nor license at this time. Should I get this radio repaired, or should I purchase another used radio of the same model and keep this one for parts? Or, should I forget this brand and look for something else? I want to keep my investment to a minimun, hopefully under $100 if possible, until I determine whether or not I am ham material.
Thanks,
Pat L.

Harold,

The 2036 could only cover 146-148 or 144-146 MHz. You
had to decide which part of theband you were going to use.

Maybe the PLL will lock on a different frequency, if so you
will have to re tweak it. If not, you may have a busted PLL.
Either way you may have to retweak the radio.

Try Amateur Electronic Supply (AES), there is definitely a branch in Orlando
on Commonwealth Ave. by Herndon Airport (I think it's herndon), and I think
they also have a branch in Tampa. They do mail order too, and the prices are
pretty good. They should be in the phone book, and I believe they usually
advertise in the major Ham Radio magazines (ie, CQ, QST, and 73.)

Good luck!

-Mike

4207. Bilal ISOTRON 160m antenna comments?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-13 18:16:12 UTC
From: galen@picea.CFNR.ColoState.EDU
Message-ID: <354q9c$29up@yuma.ACNS.ColoState.EDU>
Source record: 224331
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment

Anyone using a Bilal Isotron antenna (the one with the coil and plates)?
I'm interested in the 160m version, since it's not longer than my lot.
Galen, KF0YJ

4208. ANY NEW MODS FOR DJ-580

Date: 1994-09-13 18:38:20 UTC
From: gsmith@alpha.wright.edu
Message-ID: <Cw2zrw.KBF@mercury.wright.edu>
Source record: 224332

HI all
Looking for any new and usefull mods for the DJ-580. I already
know extended RX-TX(wires) and DTMF speed increase. I've heard that
there are a few rumors of 1.2gig rx and 900mhzTX? Anyone know about this?
-73- De Greg, N8PPZ

4209. TM-241A mobile - turn off every time?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-13 19:29:07 UTC
From: stc@unity.ncsu.edu
Message-ID: <354ui3$p8n@taco.cc.ncsu.edu>
Source record: 224337

Does anyone have experience either way - Kenwood recommends turning off
the radio before turning the car on or off. Is this really needed?
If so, does anyone have a circuit for a relay to delay power when the car is
turned on (and how do you tell when the car is being turned off?)

Thanks

KD3JN, Scott Cramer

4210. Re: Heath HW-2036 problem

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-13 19:42:45 UTC
From: Hans Brakob <71111.260@CompuServe.COM>
Message-ID: <354vblfka2@mhadg.production.compuserve.com>
Source record: 224335

There were two versions of that radio, the 2036 and the 2036A. The earlier 2036 only covered about 2MC (selected at build time) and it may be that you are trying to use it outside that range. If you can't get sync on any frequency, then you VCO may have dropped out of alignment.

Pull the skin and look near the top front of the radio, in the area of the S-meter if I remember right. You will see the VCO (a small metal box) with two adjustments through holes in the top. Note the current settings of those two components (a slug-tuned inductor and a variable capacitor). First try --very slowly-- adjusting the inductor. That generally relocks the PLL. If no setting of the inductor works, return it to it's original position and try tuning the capacitor.

If you have the manuals, I think this procedure is described in there, along with a voltage test point to monitor while doing it.

There was a Subaudible generator accessory for this radio, but it drifted all over and was unstable. I believe it used LC resonators.

You'll be beter off with an aftermarket unit.

In the Desolation Wilderness there a many repeaters as Lake Tahoe is a
popular place.
Scan around and you should hear many wide-area repeaters in use. I'd take along
something other than a rubber duck, just in case. In the other areas you
may find
slim pickings. I'd pack a portable cb as a reserve radio.

Kenwood TH79 Dual Bander Modification and Feature Guide r1.5 9/13/94
==========

Clayton Wagar, KD4IDN
920 West Crawford Street #7
Dalton, GA 30720

Here is a compiled list of modifications and features I've found for the Kenwood TH79 Dual Band HT.

Thanks to the following for their contributions to this document:
Mike Musick, N0QBF
Cole Cunningham, AA7RD
Duane Voth, KC5BGV
Chuck Scott, N8DNX

Having had many other radios in the past, and certain to have many in the future, I understand the anticipation of Amateur Radio operators to find modifications to their equipment. I started this document because I want to see _quality_ information circulated as quickly as possible, in order to save a lot of time and effort for others.

If you have any other comments, mods, or information you would like to see included in this document in the future, please send them to:
Clayton Wagar KD4IDN
yensid1@aol.com

Outstanding questions at the time this document was released:

* Rumor of a keypad modification to the radio for "Wide band" TX, RX. If you know of this mod, please write to me, even if you wish it not to be published. This would save a number of poor radios from useless torture!

Hope you find all of this information useful. Again, please send corrections or additions to yensid1@aol.com

++
I. Disclaimer
++

Well, don't you get sick of this stuff? I know, I know. However, I must say that I cannot and will not be responsible for anything that might happen to your radio, your person, your dog, or other operators you might talk to with your th79. In addition, if you decide that, with your newly modified HT, you just absolutely must cause unlawful interference with another ham or another radio service, I won't pay your NAL. Really.

Oh, and while we're at it... The extended RX/TX modifications may require you to solder or desolder really, really small components. If you want to know how small, look at the tip of an average ball point pen. Smaller than that. It takes about 1/2 of a second to wipe out several components as well as fry the board inside the 79. Please be careful.

++
II. TH79 Description and Impressions, by Mike Musick, N0QBF
++

Lulled by the sexy small size, I succumbed (or, rather, the credit card succumbed) and bought a Kenwood TH-79 dual-band H-T recently. Already owning a TH-78, the comparison comes easy.

SPECS. The TH-79A is a U.S.-spec dual-band transceiver, featuring coverage from 144-148 and 438-450 MHz. Receive coverage is extended on the 2M side from 118 to 174 MHz with AM in the aircraft band; there is no extended UHF coverage without modification. Max power is rated 5W on VHF and 3.5W on UHF with a 12V source; max power with stock 600 mAH nicad pack is 2.5/2.0. There are three power levels for each band - high, low, and extra-low (30mW). There are 80 memory channels, with no evident expansion capability. U.S./Canada version comes with the CTCSS encode/decode option. Going price at a 7/17/94 hamfest was $480.

GENERAL IMPRESSIONS. Tiny, tiny, tiny. Imagine putting a small duckie on the ARRL Repeater Directory - except that the 79 is narrower by about an inch. With the standard battery and not counting the belt clip, the dimensions are roughly 2" wide, 5" tall, and 1" thick. The belt clip adds 3/8" to the thickness; I left it off so it would be pocketable, and, frankly, it fits moderately comfortably in my work slacks' front pockets, which was surprising. It's tiny! (Oh, I said that already.)

The 79's keyboard has larger buttons than it's predecessor (lacks the cover, too) which are much easier to use. Control layout in

general is better and even in just a couple of days I appreciated the change. No more ambiguous power switch - it's in the primary band volume knob in a normal OFF/ON/VOL setup. Secondary band volume control is on the "ring" of the freq/channel encoder knob in a coaxial arrangement.

There are no squelch knobs; it a key+knob function for both bands. Squelch control was, well, interesting. There are only six "settings", with usually only the lowest setting opening the squelch under no signal. Reading between the lines in the manual, apparently the squelch circuit is semi-automatic. I expected some limitations, but had no complaints under actual use - it worked well.

With my expected habit of putting it in my pocket, I like the control lock switch - it's *not* an F-key function, but, rather is a slide switch next to the PTT. No more fumbling around to unlock it. Unfortunately, the lock function does not lock PTT - that has to be disabled with the "Tx Stop" menu setting. I found this out the hard way by putting it in my pocket and inadvertently keying-up a repeater.

The 79 has an alphanumeric display capability of two lines of 10 characters, which is used in several ways. First, there is a "guide" facility, which provides online instruction for most operation features with a scrolling display. Then there is a "menu" function, which provides access to the settings which were normally done with obscure F-key commands in the 78. Setting the various functions is very clear this way. There is also a status review mode, where the more important settings are displayed.

Finally, the alphanumeric display can be set for each programmed channel. Seven characters positions are available, and almost the entire extended ANSI character set - that's right: lower case, symbols, and accented characters - can be used. However, alpha display is mutually exclusive with frequency display. Frequency display mode can be selected in case you forgot what was "underneath" your programmed channel ID.

++
III. MARS/CAP Modification provided by Mike Musick, N0QBF
++

Here is the MARS/CAP modification for the new Kenwood TH-79A dual-band HT. Usual disclaimers about doing mods apply.

1. Remove battery.

2. Open case by first removing 3 screws (#00 Phillips) on back and 1 screw on side hidden underneath the rubber flap covering the DC power jack. Gently pry apart starting at top; BNC connector will move with back, knobs with front.

3. Spread unit out. Wires will "hinge" on the side with the PTT button.

4. Looking on the back of the keypad (front) half, locate green wire on upper left, just below the CTCSS decoder module.

5. Neatly cut this green wire, and tuck back in so ends won't touch each other or other components.

6. Reassemble.

Programmed memory will be lost since the CPU will notice the strap change and reset itself.

End result -

Before: VHF RX - 118.000-173.995 TX - 144.000-147.995
UHF RX - 438.000-449.995 TX - 438.000-449.995

After: VHF RX - 118.000-173.995 TX - 142.000-151.995
UHF RX - 420.000-449.995 TX - 420.000-449.995

Automatic repeater offset and shift selections remain normal.

And this tip comes from Duane Voth, KC5BGV...

"The MARS/CAP mod can be made without opening the entire case up. You can fairly easily cut the green wire by simply (and carefully) removing the CTCSS decoder cover and using a small pair of diagonal wire cutters."

++
IV. "Wide Band" Modification, provided by Cole Cunningham, AA7RD
++

Following is a modification for the Kenwood TH-79A Dual Band HT which opens it up to tuning from 67-174 MHz and 400-511 MHz. Actual receive was 85-135.995 AM and 136-179.995 FM with reasonable (0.5 microvolt or better) sensitivity at all the points I measured. Transmit was 136-179.995 and 400-511 with power dropping off at the ends but still usable (about 0.5w on the high scale at the band edges).

As usual, I take no responsibility for the mods, or your use of the unit after mod. Please exercise good judgement and don't endanger our ham bands with your irresponsible actions.

The observations noted are all I tried and I have no further data. This is such a delicate operation that one shot was all I wanted to do, and when it worked I quit!!!

WARNING-CAUTION-LOOKOUT-ETC!!!
The diodes to be moved are microscopic!! About 1mm long by 0.5mm wide. This mod should be done by professionals on a closed track only. Children, do not attempt this at home. Requires extremely small soldering tools and MUCH skill. I had a professional surface mount facility do mine...

1. Open the unit by removing three screws from the back and one under the DC power input cover. Carefully separate the front and back pieces. The two case halves may be disconnected by pulling the wired plug and by prying the brown latch on the ribbon cable connector up enough to release it.

2. On the front PC board in the lower right corner as viewed from the rear with the knobs pointing up there are seven spots for diodes in a row, with one diode missing.

```
|
o o o o x o o |
_______________|
2 3 4 5 6 7 8
```

The numbers are D302-D308, left to right, with D306 missing.

3. Remove D304, and D307. Put them away in a safe place (Just in case...)_

4. You should now have:

```
|
o o x o x x o |
_______________|
2 3 4 5 6 7 8
```

5. Reassemble and good Luck.

Enjoy, but don't create problems with the new capability...Wouldn't it be nice if Kenwood would make a RX only mod with these capabilities and we wouldn't have to worry about accidental transmissions where we shouldn't be transmitting. I, for one, don't want or need to TX, just RX...

73, Cole, AA7RD
August 11, 1994

(Note - This mod also adds 2 more menu settings. One of which is an AM/FM demod selector for the 300-400 Mhz band. To access this band, select the VHF band, press F, then press the Low/Hi key. Repeat to return to 144 Mhz. The AM/FM selector will allow you to listen to Military transmissions in the 300Mhz band in either AM or FM.
- Clayton)

++
V. Remote Base Operation with Kenwood 732/733
++

Kenwood has now simplified remote base operation of their mobile rigs with the TH79.

I will not give a step by step on how to control the mobile rigs, since they are different. Hoewever, to really understand this feature, I would first get to know the remote control feature on the mobile very well. This makes the following explanation a little clearer!

To access this feature, hold [PTT] and [MR] while [POWER ON].

The display will indicate -RC-, which I presume means 'Remote Control'.

If you have correctly matched your DTSS codes, frequencies, etc, the
dual bander's keypad now becomes a function pad. Pressing certain keys
enables or disables functions on the mobile rig by sending the DTMF
sequences for you.

Please note that all this fuction does is send the DTMF tones over the air
to control your mobile rig. I have not made a list of what each key does,
but as the 79 sends the DTMF tones, the display will indicate the function.
(i.e. - RPT ON, RPT OFF, TONE ON, TONE OFF, etc.)

73 de Clayton
KD4IDN

And this from Chuck Scott, N8DNX...

"The "RC" function is configured to directly control radios such as
the TM-732. In fact, if you look at the layout of the microphone remote
commands for the 732 it very closely matches the key assignments for of
the "RC" mode. Since I have a TM-732 installed in my car, I had a chance
to try this out and it's VERY convenient. Everything from direct frequency
entry with the "F" key to enabling X-Band repeat. I'm really surprised
they aren't marketing this feature of the radio."

++
VI. Post Modification Spec Sheet, by Clayton Wagar, KD4IDN
++

Here is a small chart showing the measured specifictions of TH79
S/N 60300272 after modification. The measurements were made with an
IFR 1200S Service Monitor, on the bench, with a 6V power supply.
Your milage may vary - these are just what happened with mine, and
I would suspect that most units are pretty similar.

73 de Clayton

++
VII. Cross Band Repeat, from Chuck Scott, N8DNX
++

The TH-79 does go into X-Band repeat. Press the "F" key then the "MONI"
key to enter repeat mode. Use the same to return to normal. There is a
10 min transmit limit so it's not useable for long duration monitoring of
a continuous transmission. That's understandable in light of the number
of horror stories I've heard of people frying their HT's in repeat mode.

++
VIII. Other Observations, Ramblings, Etc.
++

From Chuck Scott, N8DNX....

"Regarding the lack of a memory Lock Out function, I talked at length with the Kenwood people. They have been inundated calls about this and have told me that they are preasuring Japan to come up with a processor replacement to fix this, perhaps as a retrofit. I encourage any owner of a TH-79 to write to Kenwood insisting on such a modification at no cost and asking that they be informed when it is available. I think this is justified for several reasons. First, I have been told by another ham that the official brochure indicates that such a feature is included. Second, and more important, it is arguable that the radio is not suited to the application without memory lockout. After all, it's an 80 channel radio. To make effective use of that many channels REQUIRES a channel lockout function. Without effective use of that many channels, the radio is not comparable to the current standard for such a unit.

BTW, close inspection of the RF deck in my radio shows no obvious missing parts. I didn't remove the board to check the other side, but my suspicion is that the 800 MHz parts are installed. I'd be interested in input from others on that. So far I've not discovered how to make it display any 800 MHz frequencies though."

Harold,
I had an HW-2036 for 15 years until it was struck by lightning....
I still have the manual somewhere. I would be glad to send it to
you if I can find it. In the interim, check to see that all of
the connections on the synthesizer board are good. That is the one
that on the right side, top if you are looking from the front of
the rig.

Kevin

4217. Help Wanted .....

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-13 21:36:10 UTC
From: geo@planet-z.demon.co.uk
Message-ID: <434241164wnr@planet-z.demon.co.uk>
Source record: 224259

I have recently come into a piece of equipment (I bought it at
auction), and I dont know what it is exactly, I bought it in a job lot
marked as box of radios.

The set is obviously a mobile (car) transceiver, the only name on it is
SMC 2520. It has a large LCD display on the front, and a 4 x 4 button
matrix on the right side of the front.

On the back is a plate marked SMC 2520, VHF BAND 3 TRANSCEIVER.
This unit meets MPT 1323 and complies with MPT 1327 and MPT 1343.
Manufactured in the UK.
It also has a standard PL259 socket on the back for an antenna.

What I need to know is what freequencies does this radio operate on
(or band - ? frequency of band 3), and who if not ham's would use such
a radio.

All answers can be e-mailed to me, unless the answer is of any interest to this group.

Thanks in advance.

--
geo@planet-z.demon.co.uk (when it is working)
I don't think, therefore I am not, or am I.
A bird in the hand, deserves a poke in the bush.

4218. Re: Range of 2 meter HT

: >I will have a Kenwood T22AT running at 5 watts with the stock rubber duck
: >and the other party will probably have a Radio Shack 202 running at 4 watts

: The HTX-202 will deliver much more than that at 12VDC! Closer to 7Watts!

No, it won't. The HTX-202 delivers 2.5 W @ 7.2 VDC, 4W @ 9VDC,
5W @ 12VDC, and 6W @ 13.8VDC (source: HTX-202 owner's manual). If he's using
the Alkaline AA pack, he'll run 4 watts.

here is a needed question. I am preparing to jump the tests. I have a
ranger 2950 mobile 10 meter radio. this has sideband am fm and cw. does
anyone know if a now I am going to sound dumb, either a qsk, or qrt I am not
sure which, could be modified to work on this radio. or if a voice synthesizer
could be wired into this frequency counter?
I am blind and need some way of either typing the exact frequency in or at
least reading what it is on to make sure.
any help would be appreciated.
Mike tomlinson

Steve Steinberg (ss@JH.Org) wrote:
: o I read somewhere that due to intermod on HTs you shouldn't use
: preamps, is this true?

I'm not sure where you live, but unless it's pretty uncrowded, an FT530 with a vertical rooftop antenna is going to suffer lots of intermod, spurious response, etc. A preamp is only going to make it worse. Bag the preamp on the amp and get a helical filter to use with the rooftop antenna (or keep the preamp and still get a filter). Note that the 530 is certainly no worse than either ICOM or Kenwood late model dual-band HT's.

>

Bart:

Here is the address: Wm. M. Nye Co. Inc. as of 6/92
12031 Northup Way #101
Bellevue, WA 98005

I sent my MB-V-A in for service once and they did a good job for me. $57 out of warranty charge plus $8 freight. Howver, the prooblem has come back and I'm not using the tuner now. Problem is with switch contacts sticking open. I think I can fix this myself now that I know what is wrong.

Should you need me to copy the manual, I can do that; its only a few pages.

Message-ID: <BM2xHs6.shuster5647@delphi.com>
Source record: 224257

After checking out all the HT's available for 2 meter only, I think the HTX-202 is not the best buy. For an extra $60 you pick up a lot more memory and additional features from 2 meter only models from Yaesu, Kenwood, Standard, and even the expensive Icom line. I don't mean to knock the HTX-202. When it's on sale, you can get the unit and 5 years of service for $250. I think that the other manufacturers offer systems with more capability that you will appreciate further down the line. The extra $50 won't seem like much a year later -- only $4 plus change per month for a lot more capabilities.

Subject: Best HF antenna tuner?
Newsgroups: rec.radio.amateur.misc
Organization: NETCOM On-line Communication Services (408 261-4700 guest)
Summary:
Keywords:

I am looking for recommendations for a very tuner HF antenna tuner. I am looking for a very well constructed, and wide performance tuning capability of an antenna tuner that will cover 10 -80 or better yet 160 - 10 meters up to 300 watts of power. It seems like the only thing I see advertised is the MFJ 949e, but I have an mfj tuner a number of years ago, and quite frankly, I remember it being a peice of crap.

I would appreciate any suggestions on an excellent tuner. I have seen ads for the Tucker and the Diawa, but don't know anything about either of them

Thanks.

Source record: 224242
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

I have a DSP-59+ and an NIR-10 currently being fed in parallel.
The current test are subjective on satellites and some DX HF.
The next step is to take the output to my Soundblaster and digitize
the output into the two stereo channels. The resultant will undergo
some analysis to try and determine signal to noise ratio. I was going
to put an MFJ in the test also but they would not sell me one at the
Jacksonville Hamfest. The dealers do not seem to have them either.
More vaporware from Mississippi. I plan to test ssb and cw as well as
some of the hf digital modes. If you have some suggestions of tests
you would like to see contact me at ggs@eule.lanl.gov. As time permits
the units are going to be loaned to other hams for subjective input.
I plan to ask both hf types and vhf weak signal types to help.
Perhaps this effort will determine just who is King of the hill.
By the way I bought both of the units and have no association with
Timewave or JPS hopefully the results can be published in one of the
ham mags. 73 de Jerry KC5EGG

The "Sixer" or "Benton Harbor Lunchbox" was a popular 6 meter AM rig made by Heath. I just happen to have one. It worked fine when I put it away 20 years ago, but would probably need a bit of touching up. Interested? E-mail questions, etc. Thanks.

I personally consider good receiver performance a feature, often of more value to me than extended frequency coverage. The ARRL test of 2m HTs showed that the HTX-202 indeed has the strongest receiver available; combined with rejection of out-of-band signals, this makes for a radio that avoids the desense/intermod many others are noted for.

What do you mean by 'more capability' ? Is a big piece of this extended RX coverage? If so, then the HTX-202 doesn't have this feature. For someone like myself, living in a congested RF dense area, a strong receiver is more important.

4240. When is a Ni-Cad or NickelHydride cell charged?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-14 14:36:35 UTC
From: tgold@microvst.demon.co.uk
Message-ID: <779553395snz@microvst.demon.co.uk>
Source record: 224213

I bought some AA NiCad and Nickel Hydride AA size battery cells
together with a charger which seems to be a constant current
source. Can anyone advise me how I may recognize full charge,
such as the open circuit voltage or the voltage required to
pump say 70ma through them.

Also, my AA holder that came with my HT says on it that it is for
disposables only and that it should not be used with NiCads. Is
there a problem that I had not recognized? I had thought that
using NiCads in these was SOP.

Any hints on the care and feeding of such units will be gratefully
received, here or by email.

Check out the Radio Shack if you only want heterodyne removal. I like the
NIR-10 by JSP only for the peaking mode. The noise reduction features on
all of the highend DSP's produce an audio that I don't like to listen to.
I'd also like to do bandpass limiting in the IF, in regard to those features.
Of course I'd like notch at the IF also, but the multiple het removal is
still a nice feature of all of the DSP's and worth having esp. on 80M. I
guess I recommend the NIR-10.

Dan,
Since when has a manual been right? My Alinco DJ-162 manual specs 5W on
high from a 12VDC source, and I *measure* 6.5W, when I run of the car
with the engine running I get almost 8W on high. Specs in the manual are
the *minimum* you should expect. If you don't get at least what the manual
claims the item is defective, or the manual is lying

John,
One advantage the HTX-202 has is a lot fewer problems with intermod due to
the filter on the radio. Most if not all of the other brands mentioned have
extended receive ranges or mods and don't reject the out of band signals

I'm just getting back into Hamming after about 15 yrs. off and
want to get a good CW/SSB 9-band transceiver. Used to have a
Kenwood TS820, which I liked. I'm considering the Kenwood
TS850/AT, Ten Tec Omni VI, and equivalent Yaesu and Icom rigs
in the $2000-2500 price range. At these prices, I don't want
to make a major mistake. Any strong preferences and reasons for
such would be greatly appreciated.
Email direct to: SEM2R@galen.med.virginia.edu

: : >and the other party will probably have a Radio Shack 202 running at 4 watts

: : The HTX-202 will deliver much more than that at 12VDC! Closer to 7Watts!

: No, it won't. The HTX-202 delivers 2.5 W @ 7.2 VDC, 4W @ 9VDC,
: 5W @ 12VDC, and 6W @ 13.8VDC (source: HTX-202 owner's manual). If he's using
: the Alkaline AA pack, he'll run 4 watts.

There's nothing like an actual measurement. :-)

I get ~10 watts out from a 13.8V supply, 5 from the AA pack, and
3 from the Nicads. YMMV.

- Rich

I can only relate what can be done on SSB in the NE part of the country. From Philadelphia (unless you are in a hole), you can work at least 100 miles on 2M SSB using a 10 element beam (around 15 ft. boom length) to a similiarly equipped station. This is routine with no enhancements.

Date: 1994-09-14 16:53:43 UTC
From: hess@boi.hp.com
Message-ID: <Cw4pLM.ul@boi.hp.com>
Source record: 224260

The unit has crystals, not a synth (unfortunately). It has a new battery and an almost new drop in charger. Was owned by the Idaho Fish & Game Department. If I can't get it tuned up/working, I'll likely have to sell it, in which case the battery and charger are likely worth much more than the non-receiving radio.

I've not called Motorola parts (yet), as their manuals run in the $20 to $40 range. I was hoping to get a photocopy for the repair effort (as it would be cheaper) and then if the radio works, get a real manual.

Thanks for your replies

-Kevin

The statements/opinions expressed here are not necessarily those of the Hewlett-Packard Company. HP paid a research firm millions of dollars to get their own opinions, and has made it clear they do not wish to share mine.

This is a warranty replacement item. Yaesu has a much improved
knob, and will fix it for free or mail you the part. Call
310-404-2700 and speak to the Tech representative. They mailed
me a brand spanking new knob with a metal insert to prevent it
from coming off. Sorry, don't remember the part number.

4254. request info on Icom IC-970A/H

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-14 17:04:51 UTC
From: terry@venus.sunquest.com
Message-ID: <357afj$ajf@odin.sunquest.com>
Source record: 224281

I would very much appreciate it if somebody who owns or is familiar with the Icom IC-970A/H rigs would send me mail volunteering to answer some questions. The Icom sales brochure shows three pictures of the front of the unit, and none of the back, and not nearly enough technical info.

Actually, the -H model seems to be extinct, and I presume the -A model is going the same route. What are the net.opinions on this? Is the IC-820H intended to be the replacement? Or is Icom soon to come out with a new 970 follow-on?

Is there a review of the 970 similar to the G3RUH review of the 820H?

Does anybody have some ideas on where I might find a used 970H, since new ones appear to be no longer available?

AdTHANKSvance for any information.

I own two OMNI VIs. I have the antenna fed from one to the other in
a master slave arrangement. Only one transmits but I can receive
on both. I did this because I like dual receive mode. Only the
FT1000 has this. I also own one of them. I think this is better.

The OMNI VI has a great receiver. The QSK system is superior to
any other I've seen. Works great full QSK with my Alpha 86.

I do have a few complaints:

Can't set filters via the RS232 port.

Tuning rate is adjustable by setting microprocessor parameters.
It ought to be according to how fast you spin the knob.

I have a problem of a local AM station causing pin diode ocillation
on the AUX antenna input. I think I can fix that by changing to
a different diode.

Anyway I think the OMNI VI is the best thing going right now. If
I thought there was something better I would be trying to get it.

4259. Needed: source for 25W capable marine VHF rubber ducky antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-14 18:34:13 UTC
From: straurig@mailgw.sanders.lockheed.com
Message-ID: <straurig-1409941434130001@skydvr.sanders.lockheed.com>
Source record: 224283

Hi all,

I'm looking for a rubber ducky style antenna for a 25W marine VHF radio. Why would someone want such a thing, you ask? Well, on racing sailboats we do need a VHF, but we don't need the added weight of the antenna, or worse, the cable, up at the masthead. So we typically put a conventional metal marine 1/4 wave whip on the stern pulpit.

Anyhow, the other day we saw a boat with a rubber 1/4 wave VHF antenna. We liked it because it looked safer and more robust than the metal whip. Unfortunately, I have been unable to locate a source for it. Any pointers to such a beast, or to public service or Ham antennas that could be tuned, would be greatly appreciated.

Please email because I do not subscribe to this group.

Thanks,
Scott (straurig@mailgw.sanders.lockheed.com)

4260. HandHelds 2m?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-14 18:43:26 UTC
From: at732@cleveland.Freenet.Edu
Message-ID: <357g8e$5pq@usenet.INS.CWRU.Edu>
Source record: 224264

I am planning on purchasing a 2m handheld in the near future.
I think I have weeded out the field and have it down to three
different rigs. The Icom IC-T21A, Icom IC-2GXAT , or the Kenwood
TH-22AT. Does anybody have any comments or experiances (good
and/or bad) that could help me make my decision? I have never
owned a handheld or a 2m rig so I'm new at this.

Thanks in advance Ray WD8MAI

4261. Why can't DSP filters be put in low-level audio path?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-14 18:53:38 UTC
From: dgf@netcom.com
Message-ID: <dgfCw4v5E.Fs1@netcom.com>
Source record: 224282

For all of the DSP filter products I'm aware of, they sit on the 8 ohm audio output before the speaker. It seems this would expose the DSP to the rig's AGC action, making it harder to recover a desired weak signal when a strong (undesired) signal is nearby.

Do any of the DSP products have low-level connections appropriate for the audio path before the AGC? In particular, I'd like to use a DSP with a Ten-Tec Argonaut (which makes the pre-AGC audio available on a loop-thru basis at the accessory connector).

Any comments or recommendations?

73 Dave WB0GAZ dgf@netcom.com

I've installed a TM742A in my car with the removeable head kit, and it's pretty decent. A pain to get out to send in for service, but it generally works quite well.

The only problem I've had is with the mic remote control option - sometimes I pick up RF noise in the control lines, and it trips the repeater offset or opens the band squelch.

Consider the Yaesu 990. It's got an audio rolloff of 3KHz on all modes and consequently sounds muffled on AM. Other than that I find no big druthers. I have a Knwd 850 also. Great on AM. Like em both. The Knwd is more like operating a VCR. The Yaesu feels more like a Ham rig. The Omni VI (tried one for a week) is not as much rig for the money....drifts a little (no matter what they say...50 Hz), but I only do SSB for the most part on 80M. A dx, cw, or digital guy might find something great abt the radio. The DSP het removal can be got at Radio Shack for $80. If you can find a used rig you know about, that is the best way to go. No matter what, you will probably want to get a different one in a year or so. Like new, but used, sell for 75%. When you resell it you should get 60% or more if you don't scratch it up. So you only lose 15% or less of less, instead of 25% of more (just having a little fun here).

I have had one for some months and am pleased with it. However, I don't
think that it would be very good at removing alternator hash. If you
are having trouble with alternator whine I think it will do nicely.
Despite what the documentation says, it does not have a noise filter in
it. The "20db" noise reduction is the average reduction of the noise,
and other signals, outside of the bandpass. It does not reduce stuff
like static crashes or general "noise." Other than that it is a very
good buy.

I see quite a lot of Motorola and other brands of commercial gear for
sale in a lot of the hamfests around the area.My question is:
Wich ones could possibly be modified to work on ham bands and how
dificult would it be to do such modifications?
Since I'm on the subjet,I got my hands on a old pair of HTs made by
Motorola that go by the name of Handie-Com MH70.I wonder if anyone has
mods so that
could make them work on 2 mtr ham band.The frequency they work on now
is 151.805 mhz.
Thanks for any comments or sugestions.

>3 weeks down 15 weeks to go.....(someone hurry the FCC up...)

Jerad,
I read your comment and I had to reply to you. I took the Tech test here in Charleston, WV on March 27th, and didnt receive the ticket until July 14th. I was so aggravated that I contacted Bob Wise, our congressman concerning the delay. He used to chair the committee that oversees the FCC. Rep. Gary Condit of Calif. now chairs the committee. Wise sent him the letter and I wrote him TWICE. He didnt even reply!
I also wrote the Pres of ARRL, who did reply. My advise is, while you wait you should do something constructive, like learn the code IF you havent already. Calling the FCC is a waste of your money. My idea was for the to charge a fee and issue the license faster. But as I understand it, when the computer system that is now in place at Gettysburg is turned on, the VEC's will be able to access the test results by phone, and also get the call's back at the same time!!! Isnt that nice for those coming AFTER you?
The wait is worth it though---Since July 14th, I have worked about thirty states on Six meters, and verified about 25 of them also by QSL. I also have spent some CASH and helped the economy of some of the dealers and the mfgs. When the band opens up, SIX is fun, fun, fun. The Tech license has had the incentive that it is supposed to have, I am working on the upgrade. The code isnt easy BUT it is worth it. I KNOW just what is going on in your mind on this WAIT WAIT WAIT, AFTER, YOU PASSED the test!

73's to all.

4273. CW filter for the ICOM IC-735

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-15 01:20:01 UTC
From: n0at@aol.com
Message-ID: <3587g1$p5n@search01.news.aol.com>
Source record: 224289

I have an ICOM IC-735, and would like to improve the cw filtering capability.
The radio presently has the ICOM 500Hz CW filter in the 1'st IF (9 MHz). I would like to install a cascaded 500 Hz CW filter in the 2nd IF (455 KHz). Has anyone installed an aditional CW filter in the 2nd IF? What kind of modifications to the radio would be required?
Thank you - Ron N0AT

4274. Kenwood TR-2600 mods needed

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-15 01:36:16 UTC
From: jdwong@antojito.engr.ucdavis.edu
Message-ID: <3588eg$9hd@mark.ucdavis.edu>
Source record: 224272

Does anyone know how to do the extended transmitter
coverage modification for the Kenwood TR-2600 hand held?

If there is an FTP site for Kenwood mods, I would be interested
in that also.

Thanks

-Joe

4275. Yaesu's "Advanced Track Tuning" re: FT-2500

Newsgroup: rec.radio.amateur.equipment

Message-ID: <358ail$hjo@charm.magnus.acs.ohio-state.edu>
Source record: 224292

I still can't find, anywhere in the manual, exactly what this means. My guess would be that they're just using the VCO tuning voltage to tune the (somewhat narrower) front end. Am I right?

Is the meter accurate? I would not be surprized if it were not,
especially at low power levels.

From mountaintops the range of a 2m repeater with a 1/2 wave could be
70 miles. Perhaps no more than 1-5 miles with a rubber duck otherwise.

4282. Garage door remote control--->parts?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-15 16:12:50 UTC
From: sharpe@u.washington.edu
Message-ID: <359rq2$d7v@news.u.washington.edu>
Source record: 224221
Cross-posted to: alt.home.repair,rec.radio.amateur.equipment

Sorry to the ham radio buffs if this seems off topic but thought you guys would have some info on this.

I'll cut to the chase. Does anybody have suggestions as to how to find a transmitter unit for an older (approx 15 yr) remote control garage door opener? Motor is a "Stan-O-Matic" and separate remote control unit is made by Multi-Elmac Corp. or Novi, Michigan. Please reply via e-mail as I don't regularly read these newsgroups. Thanks.

Full sob story is below.

I've got an older model garage door remote control opener with only one working remote transmitter. I'm trying to get my hands on a second transmitter without much success. Have called various garage door installers in the area with no luck. Seems remote control garage door technology has evolved over the past 15 years such that they don't have compatible transmitters and have few suggestions (other than buying a new unit, of course). I've tried calling the manufacturer (Multi-Elmac) but no listing. Have written (about 6 weeks ago) but no response. Would Radio-Shack have this sort of thing?

Thanks

Bill Sharpe

4283. DRAKE PS-75 POWER SUPPLY

4285. Standard C1208DA 2-meter mobile

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-15 18:27:55 UTC
From: kevin jessup <kevin.jessup@mixcom.mixcom.com>
Message-ID: <1994Sep15.182755.25969@mixcom.mixcom.com>
Source record: 224203

I recently purchased the Standard C1208DA 50 Watt 2-meter mobile.

So far it seems like a nice rig. The main unit is pretty small
(5.5 x 1.2 x 5.8), about the size of a Kantronics KPC3 TNC. Great
for a compact car.

All controls, LCD, speaker and mike are in a small handset.
The audio output is better than an HT but not as good
as my Yaesu FT2500M 2-meter mobile. (There is an external
speaker option.)

Does pretty good with wide-band receive:

100 MHz to 200 MHz (with Aircraft AM)
250 MHz to 520 MHz
also gets 800 MHz (this is not advertised and cellular is blocked)

So far (have only had it 3 days) I have not noticed any intermod
troubles when using a 1/2-wave whip while mobile.

Curious if anyone else has one and has had any problems or discovered
any mods yet. I took the cover off the main unit but found no
obvious jumpers/pads/loops. I didn't try taking apart the
handset yet.

The 2-meter/70-cm dual-band version of this is the C5718DA.

4286. How is Ramsey 6m unit?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-15 18:43:11 UTC
From: neubauer@uwplatt.edu
Message-ID: <1994Sep15.124311@aspen>
Source record: 224207

Hello.

I am considering 6m equipment and it looks as if my best bet is a
Ramsey kit considering availablity and price. However, a couple years
ago I had some bad experiences with the original 2m Ramsey. These
included a too-sharp squelching, low output power, and an incredible
sensitivity to supply hum.
That was the original 2m a couple years back. Now I know that the
2m design was changed and am willing to consider Ramsey VHF transcievers
again.
I would like to know if anyone has any experience with the Ramsey 6m
kit. Specifically does it have the same faults as the old 2m design?
Anything else you think I should know. Post or e-mail is fine.
Yes, I know it's FM only, but I don't need all-mode.
Thanks for your time/net.bandwidth.

4287. Re: Why can't DSP filters be put in low-level audio path?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-15 19:36:43 UTC
From: dnewkirk@arrl.org
Message-ID: <1994Sep15.193643.5088@arrl.org>
Source record: 224206

David Feldman (dgf@netcom.com) wrote:

: For all of the DSP filter products I'm aware of, they sit on the 8 ohm audio
: output before the speaker. It seems this would expose the DSP to the rig's
: AGC action, making it harder to recover a desired weak signal when a strong
: (undesired) signal is nearby.

: Do any of the DSP products have low-level connections appropriate for the
: audio path before the AGC? In particular, I'd like to use a DSP with a
: Ten-Tec Argonaut (which makes the pre-AGC audio available on a loop-thru
: basis at the accessory connector).

: Any comments or recommendations?

The Ten-Tec Argonaut--and I assume you don't mean the Argonaut II--and some other Ten-Tec radios of several equipment generations back used audio AGC, but--at least in analog radios--non-RF-derived AGC is an anachronism in high-performance gear except in highly specialized applications. So looking for an audio DSP product to have I/O ports of levels and impedances suitable for use "before AGC" may vector your search into the weeds.

You're onto something worthwhile, however, in the sense that letting the audio you want to low-level filter go all the way through your radio's audio chain and out through its power-amp IC so you have to attenuate it for application to the DSP circuitry is a hair on the dumb side -- *except* that these DSP boxes are aftermarket devices, and must default to "8 ohms in," input attenuation and containing their own seemingly redundant power amps because none of our radios have low- or line-level "send" and "receive" audio jacks (like sound-reinforcement and recording panels tend to have for 'FX'--sound effects--devices like reverbs, phasers, delay lines, etc) necessary to do it the "right" way.

It would be best if we could patch audio DSP into our radios as soon after our radios' detectors as possible, assuming that matters of gain distribution and noise figure are under control. Warranty matters aside, if you're willing and able to dig into your radio and DSP box and do a bit of patching, you could probably effect the necessary low-level I/O yourself. (This is assuming that your radio's post-DSP audio chain would be worth using, by the way; even some multikilobuck radios have significantly hissy power-output chips that we might as well let aftermarket, "8-ohm input" DSP clean up.)

From: hamilton@BIX.com
Message-ID: <hamilton.779686530@BIX.com>
Source record: 224222

Following up on Dave Feldman's and Dave Newkirk's comments, I just don't understand what's so hard about having a pair of jacks on the back of the rig so you route the audio thru some outboard processors before it goes to the power amp stage. Are all the major manufacturers that dumb or just deaf that can't get this message? The stereo manufacturers (and come to think of it, aren't some also ham equipment manufacturers?) have had this figured out for 20 years. Can you component? I knew you could.

Setting aside questions about whether it's more "efficient" or whatever to send the preamp vs. power amp outputs thru a DSP, it should be obvious they are not equivalently convenient! On my FT-990, e.g., there are some Din connectors for connecting a TNC. The audio output to the TNC is fixed-level, allowing me to turn the volume down independently once I've got a station tuned in. Great! But if I want to put a DSP in there, I've got to give that feature up. Why, for heavens' sake?

intermod problems are worsened with the preamp, so turn it off in an urban area. at least you have it available when out of the urban jungle. i use this amp in chicago and as long as i turn the preamp off in the downtown area it works fine. by the time i get 10 miles outside downtown i turn it back on and everything works fine.

you can excite the amp with as little as 1 watt on uhf or vhf, at least i do with a kenwood th78-a.

A buddy of mine is going to sell his dads radio equipment.
His dad recently was killed flying his plane. So he would
like to find out what a reasonable selling price for the
following radios are
a dual band icom 24at. this is an older model serial no. 07686
(if I am allowed to print such things) maybe someone has an idea.
I don't know how old this radio is. I imagine if its dual-band it is
recently new.
the other radio is a Yaseu ft-747gx. I know relatively little about
older hf radios. especially regarding value. I see that I also misspelled
yaesu.
There is also mfj versa tunner II model mfj-945c.

I would like to see him get a reasonable price so I just wanted some
ballpark figures. Considr the radios are in good shape. The handheld
is kind of sexy but I would probably prefer a newer one with larger
buttons. If you find you must own any of the above then let me know
thanks
sean

At one time HeathKit sold the Multi-Elmac radio system with their garage door opener kit. Heath still runs a parts business in Benton Harbor MI, though I do not have their 800 number at hand. Information can find it for you.

If all else fails, Sears sells (or at least sold) a complete tranmitter/receiver system for about $25; you can wire the relay contacts in their receiver to substitute for a open/close pushbutton and I did this some years ago to replace a failed Chamberlain receiver unit.

Doug -

In addition to the TNC audio, there is another fixed-level audio out
on the back of your FT-990. Check the labels on the RCA jacks for "AF
Out" (look at the bottom row of jacks). There is also a
variable-level output ("SPEAKER Out") in the top row of jacks.

Therefore, you can have your audio DSP -and- your packet too, since
packet audio is on one of the DIN pins. Or, you may wish to run the
(packet) audio throught the DSP unit before processing by the TNC.

I am trying to get large electrolytic capacitors.
They are the can type with bolt on terminals.
The values I am looking for are

0.5 F and 1 F. (Yes farads not microfarads)

They only need to operate at at between 15 - 20 volts.

I have tried RS Components, Maplin and CPC all to no avail.

If anyone knows of a company that may supply these, can you please let
me know.

Thanks in advance.

geo.

> From mountaintops the range of a 2m repeater with a 1/2 wave could be
> 70 miles. Perhaps no more than 1-5 miles with a rubber duck otherwise.

The biggest limitation suffered by HTs is not power or even rubber ducks but rather the fact they are operated 5.5 ft above your feet (ie, ground level.) Under _normal_ conditions (no ducting, etc) an HT, or any other VHF/UHF radio, is limited in range by line-of-sight path within the antenna radiation pattern. The power level or type of antenna becomes a lower order effect given a clear line-of-sight.

Again under normal atmospheric conditions, the maximum distance over which you can hit a VHF/UHF receiver without intervenning obstacles is approximately sqrt(2*Hf1)+sqrt(2*Hf2) statute miles, where Hf1 & Hf2 are the height in feet of the two antennas. I have had an airborne QSO at a distance of 205 miles with full quieting using a "stock" Standard 528 and antenna putting out just under 3 watts on 70cm. There was nothing magic about it; I simply had the necessary altitude. The Space Shuttle SAREX doesn't need, or use, any more power when operating from batteries.

73,
John

I was not happy when I saw this rig hit the market. I thought, hell, there goes the six meter band the way two meters went. Even so, I recently purchased one of these 6 meter rigs from one of the national distributors. The sale price was $979.00. I have used it for about 2 months. I spend about 1/2 hour twice daily on FM running 100 watts and it seems to handle ok though the heat sink does get hot. Used it on SSB a couple of times, and it does fine on that mode. It is a lot of money for a single band rig but, it is nice. Someone who is into 6 meters already would appreciate this rig. It might not be a good idea to spend this kind of money to see if you "like" six meters though. If you have local FM activity in your area, you might find that its a lot of fun. I would not recommend this rig to someone to buy just to work sideband dx, #1, there is not a lot of activity compared to the other HF bands and #2 I like to rag chew and have no interest in working someone just for them to get my grid square. I would stay on 17 or 10 meters and enjoy more contacts. By the way, RX on the 60S out of the box is 40-60 MHZ. Two large distributors that I have dealt with is the past are:
Ham Radio Outlet 800-444-4799 & AES 800-558-0411

Yes, I know what connectors are there, Lou, but that's not what
I want. If I attach the DSP to fixed level audio out, then by
definition, the AF gain control doesn't do anything (and I hate
knobs that don't do anything :-) and I have to use the gain control
on the DSP (assuming it has one). I judge that as less convenient
and when it's my money, things like that are indeed factors in
my decisions.

On the other hand, if I attach it to the speaker outputs, then I
can't also run it to the TNC without giving up the ability to turn
up the volume while I'm tuning around the band but turn it back
down again when I've linked. Also, the cabling arrangement gets
that much more Rube Goldberg-like. (As it is, Yaesu blew it with
separate RTTY and packet DIN connector and the key only on the phono
jack. That forces me to cable from the one TNC connector to 3
different connectors on the 990. Yaesu should have used a single
connector combining the 5 signals on the packet DIN + the one other
unique signal on the RTTY DIN + a straight key input so you use the
TNC to send CW without having to switch off the keyer from the front panel.)

Again, what I really want -- and why is this so difficult?! -- is
just a pair of RCA jacks to let me loop a DSP in between the pre-amp
stage and the various line outputs and power amp inputs in the rig.
Seems darn simple to me.

I own a TS-850SAT and upon seeing this discussion and especially your comment
dug into my schematics a little and it would appear that Kenwood has done
just exactly that. The TS-850S has three jacks on the back,
labeled DSP-1 DSP-2 & DSP-3. As near as I can tell, and someone correct me if
I am wrong, these come out of and go back into the IF unit. It looks like
they are trying to provide the performance desired...the only thing is, their
DSP unit is _expensive_ and I don't know if it provides the functionality of
aftermarket products. Maybe someone could do an article comparing this unit
and its performance levels against the aftermarkets to see which is better?
Also, maybe someone would want to tackle making an aftermarket unit that would
utilize these ports to their advantage?

Digi-Key carries Toko helical filters, and Hamtronics also offers
a filter, or a filter combined with a gasfet preamp. I use the
latter on a repeater in a very high RF environment, recomended.
Of course you don't want to transmit through these filters, especially
the one with the preamp, so you'll need some sort of TR switching
arrangement. One way to do that is to replace the preamp in a
brick amplifier with the filter or filter/preamp. The extra power
the brick supplies on transmit will also be welcomed by amateurs
forced to listen to your handi-scratchie.

4314. Mail order Radio Shack stuff

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-17 04:18:00 UTC
From: clint.bradford@ectech.com
Message-ID: <940917130017530@ectech.com>
Source record: 224146

(Continued from previous message)

surprisingly sturdy, and well constructed, considering that
Maxon's Quality Control has, in the past, been suspect.

Most HTX-202s will not take a BP-7 Icom pack. The BP-8 usually
works well. If the Zener diode in the bottom-feed circuit is bad,
only a 9.6-vdc pack or less will work. A minor headache at the
very least.

ALWAYS: Slide off your NiCad pack when using external DC power from
your vehicle or a power supply! Leaving the pack on while mobile puts
too much burden on the Zener diodes, and generates heat at twice the
normal rate. Save your radio and take off the pack!

Unlike it's Icom brother, the 202 will not top charge an Icom pack
while on external DC power. Refer to the warning above!

WARNING: DO NOT ATTEMPT TO BOTTOM-CHARGE THE STOCK NICAD PACK IN AN
ICOM BC-35 OR CLONE CHARGER.

---
* QMPro 1.52 * Time flies like wind. Fruit flies like pears.

4315. Mail order Radio Shack stuff

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-17 04:18:00 UTC
From: clint.bradford@ectech.com
Message-ID: <940917130017529@ectech.com>
Source record: 224245

W>I heard a rumor of a mail order house in Texas (Merrymac ?) that sells
>Radio Shack stuff at a discount (I'm looking to buy an HTX-202). Anybody
>have an address and/or phone number?

The HTX-202 is on sale right now for $199. at any Radio Shack store.
Don't know if Marymac can beat that sale price!

The HTX-202 has 12 independently-programmable memory channels,
plus one calling and three priority channels. It comes with
continuous tone squelch encode -AND- decode. Power output is
5 watts minimum (7w typical) with 12 VDC supply, 3 watts
@ 9 VDC or 2 watts @ 7.5 VDC. Low power setting provides 1
watt output. A power saver circuit with programmable 1/2, 1/4,
1/8, or 1/16-second duty cycle. Batteries are compatible with
larger ICOM (IC-2AT/IC-32AT) series HTs.

Repeater offset can be adjusted from 0 to 4 MHz in steps as set
by the scan frequency step selection (5, 10, 20, 25, 50 or 100
KHz). Memories store any offset, and any combination of
continuous tone frequencies.

Size is 65 x 117 x 37 mm. To put this in perspective, with
alkaline packs on the 202 and my ICOM W2A, both are the same
thickness. The 202 is maybe 1/4-inch wider (at widest part),
and 1/16-inch taller (it's hard to compare because of the
irregular shapes of HTs.) The HTX-202 does give the impres-
sion of being a "mid-size" HT until viewed up against something
like the little W2A, which actually has three different "widths."

Supplied with Nicad battery, charger, 6-cell alkaline battery
case, antenna, wrist strap and belt clip.

Now, the good stuff...

* True FM modulation (not phase modulation) for outstanding
transmit audio and best performance in packet service.
* Continuous tone squelch transmit and receive tones are
independently programmable.
* In addition to DTMF dialing, there is 5-digit DTMF selective
paging (DTMF squelch).
* A five-number memory dialer that stores 15-digit sequences
for autopatch use or DTMF paging.
* Scan for either active -- or vacant -- channels, with
programmable scanning step of 5, 10, 20, 25, 50 or 100 KHz,
and upper and lower scan limits (for VFO scan.)
* FAST, 25 channels/second scanning.

* Selectable priority channel scan interval, every 4, 8, 12 or 16 seconds.
* Multi-function scanning lets you scan standard memories, priority freq. memories, or a frequency range. Resume can be after 10 seconds, when carrier drops, or remain on channel (don't resume.)
* Transmit timeout - if you frequently time-out your local repeater, this circuit will stop transmitting after a preset delay (30, 60 or 120 sec.) and sound a beep. In effect, it forces you to reset the repeater before the repeater times out. Of course you can disable the timeout circuit.
* The HTX-202 carries a 1-year parts and labor warranty.

Subjectively, this HT has exceptionally strong, un-distorted receive audio you'll really appreciate when walking around the local (noisy) hamfest. You won't believe the sound is coming from an HT! Transmit audio is crisp, clear and strong.

I put a 5/8-wave mag mount on my car, and used the 202 in the very intermod-rich downtown Ft. Worth, TX area. I've never been able to use an HT on an outside antenna within 2 miles of down-town Ft. Worth before. This one performed magnificently. My ICOM 2400 dual-band mobile gets less intermod than any other radio I've used in this environment, and the HT stayed with it, toe-to-toe. When the ICOM heard intermod, the 202 heard it, but when the ICOM was quiet, SO WAS THE HT!!!!

Even more impressive, the HTX-202 heard signals through the intermod, when the IC-2400 could not pull 'em out! Reason is probably because we purposely limited coverage to ham band ONLY! It can't be modified for out-of-band receive. The design objective was to build a specialized ham radio product that does the best possible job on the ham bands, and that includes the tightest, most intermod-free front end we could design into an HT! The published spec says intermod attenuation is 60db minimum. Spurious response and adjacent channel rejection are also 60db.

The HTX-202 is based on the ICOM 02AT with certain design modifications based on Tandy's specs. These variations include the encode/decode, additional memories, and a full width LCD display. Contrary to rumor, no part of the radio is Kenwood or Yaesu! ICOM sold the rights to their design to Tandy to do with what they would.

Whan Tandy sought to produce the unit, they went to their usual Korean source for cheap gadgetry: MAXON. Maxon then built the HTX-202 for Tandy, under license from Icom. The HTX-202 is

Since I have noticed many people wondering about types of
handhelds to be purchased ....

I have a FT-530 which had the BNC connector move on the case and
loose contact with the circuit board behind it (It broke). After calling
Yaesu in California I sent it in via UPS etc. About one week later the
repair was done and my handheld back in my hands working and covered
under warrenty. I found this service great no BS, fast turn around,
done correctly etc. Note - The BNC connector moving ... I use
the handheld bicycling, in the car, walking, and generally do not
treat it the best.

I hope other people have the same results in repairs.

I am not associated with any equipment sales ... just my
experiance with a repair.

4321. BP3 Pack Info Needed

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-17 19:29:28 UTC
From: ceddlemon@stim.stim.tec.tn.us
Message-ID: <1994Sep17.132928.465@stim.stim.tec.tn.us>
Source record: 224241

Anybody got the circuit diagram for a BP3 pack? There may be more than one version because I think I 'eyeball' compared an original one with a later one I purchased and could see different components. My problem BP3 doesn't have the "roller ball" on the interface plate.

The pack was given to me with some wiring (component?) problems. I replaced a loose wire inside the pack and put in a new insert about 18 mo. ago. When this pack wouldn't take a charge I ordered a new 400 ma insert for it. It too won't take a charge with this pack. So I've traced the simple circuit. It's got a current limited LED indicator and another couple of diodes, a capacitor, and a couple of resistors.

Guess the replacement insert could be faulty ...? Nah, well not likely. But if this pack is salvageable I would like to not let the insert go to waste.

If anyone has good info on the BP3 circuit I would like to hear from you.

The Kenwood TS850s, when equiped with the optional DSP unit, performs
an additional conversion to generate a ~38Kc IF. The DSP is used
primarily to modulate and demodulate rf. It is not really used
to denoise, filter or remove heterodynes like the after market units.

Message-ID: <CwAxzr.B1G@cruzio.com>
Source record: 224150

I just picked up the HTX-202 (on sale, of course) and was quite
pleasantly surprised. Even with a wide band discone attached
(which should attract intermod like crazy) the RX has been
very clean. Through the repeaters to distant sites I've been told
that my TX signal is full quieting and very clear. The manual
is well written and easy to understand, another pleasant surprise.
I was initially drawn to this unit because of the direct FM for use
with packet, but am having so much fun I might just wind up using it
for voice more often. After one week of use, a big thumbs up!

A good beginner's rig at least, a good backup unit... and even
the old pros might like it too... at least it has served its major purpose
for me, to keep me interested in Ham Radio by providing a nice unit
at an affordable price... until I can afford a tribander... ;@}

It also has the further advantage of being backed by a nationwide chain,
with the 5 year warranty available. I'm currently helping organize the
communications logistics for a 1995 TransAmerica bicycle trip and I'm
recommending this unit as the unit of choice for the riders.

The little lapel mike is nice too... ;@}

Source record: 224151

I know I've heard many Ford Explorer owners complain about very strong noise --coming from the fuel pump-- causing an S-9 or better noise level on HF transceivers. Ford has a tech. svc. bulletin out recommending installation of two filters directly on the fuel pump (which is INSIDE the fuel tank). Ford dealers will do it under warranty. Both AA5FL and I have had the mod done, to no avail.

Has anyone whipped this problem??

Thanks... Ed, W5TOO

4326. Radio Shack HTX-202: Good Buy

4327. Icom IC-T21A mods? Anyone know?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-18 04:38:19 UTC
From: AE85%NEMOMUS.bitnet@ACADEMIC.NEMOSTATE.EDU
Message-ID: <17SEP94.25532791.0090.MUSIC@NEMOMUS>
Source record: 224153

I just purchased a used Icom T21A handi. This is the very compact 2m HT with "bonus band" 440mhz receive. I was told it had already had the expanded receive mod done, which is evidently so. The VCO seems to lock at about 66 mhz and everywhere on up to 999 mhz. I can barely pick up a 50,000 watt fm broadcast station 2 miles away, so sensitivity is not good that far out of intended reception range. (Obviously distortion is severe receiving wide band fm).

Does anyone know how the mod is accomplished? How about TX mods? Any neat "keyboard" mods? Other neat hidden features? In what ranges of frequencies is the receiver sensitive enough to actually pick up signals. I know our electric company uses 800mhz, but I have yet to hear anything even though I can program their frequencies.

Thanks in advance for any light you can shed on the joys of this neat new toy of mine!

>unit, of course).

One of the best deals around on this kind of stuff is to go to Sears.
They have available (perhaps not on the shelf of your local store - but
they can get it) a complete replacement radio control system with one
receiver and one transmitter for about $50. A second TX is about
$12-15. These are full digital. A fancier 3-button unit that will
control a couple of little lamp on/off modules costs a little more.

A friend has a three button unit with the main button controlling a old
Genie unit, button two trips a pulse-on/pulse-off relay that turns on
the yard lights (between the house and the garage), and button 3 trips
a time-delay relay that bypasses the garage door switch on the household
alarm for 3 minutes. A keypad in the garage can be used to control the
overall alarm.

It scratches his itch at a rather reasonable cost.

>Don't know if Marymac can beat that sale price!

Marymac's every day price is $180 which includes shipping to your doorstep in
the U.S.

So, add $40 for the 5 year warranty (which includes dropping the thing when
you are carrying it around) and it is only $220 for an HTX-202 plus the 5
year warranty, delivered!

I haven't found anything comparable in features and price to the HTX-202, yet.

I suggest you get the 20 amp model. Astron ratings are for *peak*
current output, not for the steady output an FM amplifier is going
to require. You'd need a 16.9 amp rated Astron to supply 12 amps
continous, and they don't make one in that size. The 20 will handle
it nicely.

No, what's worse is having a 2m HT, listening, and STILL waiting for your ticket.

I agree. Arggghhh!

4342. W2A Mod???

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-18 23:34:52 UTC
From: jviennea@news.delphi.com
Message-ID: <35iiqs$9t8@news.delphi.com>
Source record: 224166

I have a W2A that I had done the extended receive mod too but I
had to reset the CPU and now it's back to it's former state. Of course
I no longer have the directions... So, if you have it handy, I'd SURE
APPRECIATE IT if you could send the mod instructions my way.

Thanks, 73, WB1B

ps: Pointers to internet mod servers is OK too!

4343. Yaesu 2700RH schematic?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-18 23:39:05 UTC
From: jviennea@news.delphi.com
Message-ID: <35ij2p$a1p@news.delphi.com>
Source record: 224167

I have an old Yeasu 2700RH dual band mobile that I could really use a schematic or service manual photocopy. I'd be happy to pay any expenses.

Thanks, Jim WB1B

4344. HandHelds 2m?

Newsgroup: rec.radio.amateur.equipment

From: clint.bradford@ectech.com
Message-ID: <940919130022556@ectech.com>
Source record: 224192

A> I am planning on purchasing a 2m handheld in the near future.

I can save you some money.

Purchase a HTX-202 from Radio Shack this week while they're still
on sale for $200.00.

Ultra-miniature in size? No.
Beautiful to look at? Not necessarily.
Solid performer? ABSOLUTELY!!!

The HTX-202 has 12 independently-programmable memory channels, plus one
calling and three priority channels. It comes with continuous tone
squelch encode -AND- decode. Power output is 5 watts minimum (7w
typical) with 12 VDC supply, 3 watts @ 9 VDC or 2 watts @ 7.5 VDC. Low
power setting provides 1 watt output. A power saver circuit with
programmable 1/2, 1/4, 1/8, or 1/16-second duty cycle. Batteries are
compatible with larger ICOM (IC-2AT/IC-32AT) series HTs.

Repeater offset can be adjusted from 0 to 4 MHz in steps as set
by the scan frequency step selection (5, 10, 20, 25, 50 or 100
KHz). Memories store any offset, and any combination of
continuous tone frequencies.

Size is 65 x 117 x 37 mm. To put this in perspective, with
alkaline packs on the 202 and my ICOM W2A, both are the same
thickness. The 202 is maybe 1/4-inch wider (at widest part),
and 1/16-inch taller (it's hard to compare because of the
irregular shapes of HTs.) The HTX-202 does give the impres-
sion of being a "mid-size" HT until viewed up against something
like the little W2A, which actually has three different "widths."

Supplied with Nicad battery, charger, 6-cell alkaline battery
case, antenna, wrist strap and belt clip.

* True FM modulation (not phase modulation) for outstanding
transmit audio and best performance in packet service.
* Continuous tone squelch transmit and receive tones are
independently programmable.
* In addition to DTMF dialing, there is 5-digit DTMF selective
paging (DTMF squelch).
* A five-number memory dialer that stores 15-digit sequences
for autopatch use or DTMF paging.
* Scan for either active -- or vacant -- channels, with
programmable scanning step of 5, 10, 20, 25, 50 or 100 KHz,
and upper and lower scan limits (for VFO scan.)
* FAST, 25 channels/second scanning.

* Selectable priority channel scan interval, every 4, 8, 12 or 16 seconds.
* Multi-function scanning lets you scan standard memories, priority freq. memories, or a frequency range. Resume can be after 10 seconds, when carrier drops, or remain on channel (don't resume.)
* Transmit timeout - if you frequently time-out your local repeater, this circuit will stop transmitting after a preset delay (30, 60 or 120 sec.) and sound a beep. In effect, it forces you to reset the repeater before the repeater times out. Of course you can disable the timeout circuit.
* The HTX-202 carries a 1-year parts and labor warranty.

Subjectively, this HT has exceptionally strong, un-distorted receive audio you'll really appreciate when walking around the local (noisy) hamfest. You won't believe the sound is coming from an HT! Transmit audio is crisp, clear and strong.

I put a 5/8-wave mag mount on my car, and used the 202 in the very intermod-rich downtown Ft. Worth, TX area. I've never been able to use an HT on an outside antenna within 2 miles of down-town Ft. Worth before. This one performed magnificently. My ICOM 2400 dual-band mobile gets less intermod than any other radio I've used in this environment, and the HT stayed with it, toe-to-toe. When the ICOM heard intermod, the 202 heard it, but when the ICOM was quiet, SO WAS THE HT!!!!

Even more impressive, the HTX-202 heard signals through the intermod, when the IC-2400 could not pull 'em out! Reason is probably because we purposely limited coverage to ham band ONLY! It can't be modified for out-of-band receive. The design objective was to build a specialized ham radio product that does the best possible job on the ham bands, and that includes the tightest, most intermod-free front end we could design into an HT! The published spec says intermod attenuation is 60db minimum. Spurious response and adjacent channel rejection are also 60db.

The HTX-202 is based on the ICOM 02AT with certain design modifications based on Tandy's specs. These variations include the encode/decode, additional memories, and a full width LCD display. Contrary to rumor, no part of the radio is Kenwood or Yaesu! ICOM sold the rights to their design to Tandy to do with what they would.

Whan Tandy sought to produce the unit, they went to their usual Korean source for cheap gadgetry: MAXON. Maxon then built the HTX-202 for Tandy, under license from Icom. The HTX-202 is

Source record: 224175

I need help. I have a small sports car with a 2m mobile radio and a scanner mounted in it. The scanner is connected to the FM radio antenna while the 2m radio has its own antenna. You can guess what happened to the scanner after transmitting. Yes I blew the 1N914 diodes in the scanner. I now have a coax switch in line with the scanner, but it is a pain to shut off the scanner, push the switch, take down the radio antenna before I can TX. Has anyone had experience with this problem. I would love to have a switch that senses the RF and switches the scanner out of line. Does anyone know of a duplexer that would work? Any help would be greatly appreciated.

tnx in advance,

Well Doug,
I think it started out this way (speaker level input required) because
all rigs (99.999%) have a speaker output but not all, at least not the
"cheepy" ones have a fixed or line level audio output. Of course, it
would be very simple for the manufacturer of the DSP to put both line
level and aux level inputs on his DSP. The only problem is that it
would raise the cost of manufacturing the DSP a dollar or so, so he
would have to raise the price by about $20!

4362. Need mic/ear wiring info on Icom-W2A HT for project

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-19 16:44:49 UTC
From: j.perry@lynx.dac.neu.edu
Message-ID: <35kf61$qk5@lynx.dac.neu.edu>
Source record: 224183

I am currently building the earphone microphone project from the
November 1990 QST. This is the first project I have built for my new
icom-w2a so I need some information on how to wire the audio mic and
output to this circuit. I just need simple stuff: which wire pairs
carry audio and which mic audio and how to change from audio to mic mode.

I am also interested in hearing from anyone else who has built this project.

Thank You in advance for any info you can give!

(PS. I checked the mods ftp archive and found no info on this. Someone
might want to add this to the archive since people connecting HTs to
TNCs often ask for this information)

Please respond direct and I will email summaries to anyone who asks for
one.

4363. Re: AZDEN PC3000

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-19 17:03:51 UTC
From: kenw@col.hp.com
Message-ID: <35kg9n$6l7@hp-col.col.hp.com>
Source record: 224184

In my opinion (after having owned this model) I would put my $150
into a more recent radio. The Azden PCS-3000 had a history of
phase lock loop (PLL) problems, and you may find yourself continuing
to sink money into this rig.

Also, why don't you have a technically-inclined ham check out this
rig? Most rigs will have "birdies" on a few frequencies due to the
internal microprocessor circuitry getting into the receiver. These
would sound like tones or whistles as you tune the receiver freq.
So long as these interfering signals are not on a frequency you
wish to listen to, they shouldn't hurt. It is a possibility that
the radio technician is sensing your inexperience and may be trying
to rip you off. This is not an accusation, but simply a warning
to be cautious.

Panasonic makes some pretty big caps. Check out the SG, AL, and NF Series "Gold Capacitors". Up to 10 Farads at 2.5V or 3.3 Farad at 5.5V. Maybe they make others or you could series connect them. They're listed in the Digikey catalog. Oh, and these are PCB mount.

Hello Fellows!

Does anybody where to get *a Macintosh software* for planning, testing, and building YAGI antennas? My friend who is needing this prefer to find something that is free or shareware. Also, all Macintosh programs which loosely relates to the ham-radio, etc. area are needed.

Could you send me the suggestions for the FTP, Gopher, WWW sites to my address below. I prefer personal mail, since I don't follow this list activily.

Thanks!

> : Can anyone give me a source of 2m & 440 filter?

DigiKey carries Toko helical filters. They have a couple of pretty narrow ones in the 2 meter band. You'll want to turn the preamp back on- they cost you 8dB insertion loss. The trick is splicing the filter into the preamp so you don't try transmitting through them. Digikey is at 800-344-4539.

Toko 272MT-1006A 145 MHz center, 2.8 MHz bw, 25 dB down 6MHz off center. $28

Toko 5HT-44020AS-440 440 MHz center, 14MHz bw, 25 dB down 50 MHz off center, $20

DigiKey will happily sell you a Toko catalog for about $10, but I'd look for a local rep first and see if you can get one for free. The DigiKey catalog is free, and they're pretty reliable.

In <EMILEYMS%CS09.6@cadetmail.usafa.af.mil> EMILEYMS%CS09@cadetmail.usafa.af.mil (MARK S. EMILEY) writes:

>If anyone has any mods for the Kenwood TH-28, please post them. Please
>specify what they do and how to actually do it. Thanks.
>C4C Emiley

Here is something I prepared a while back. Read carefully.
I successfully performed the mod on a TH28A. Note the "A" suffix!

23-July-1993

The following is an extended receive mod I received for the
Kenwood TH28A 2-meter handheld transceiver. It involves a lot
of hardware hacking. I have discovered a MUCH easier way to
implement the mod. Perhaps I have a newer revision circuit
board? Anyway, here is the original mod. The simpler method
will follow.

****
ORIGINAL MOD
****

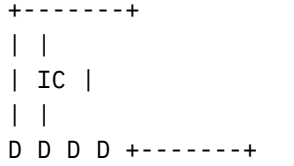
I just got the following. I CANNOT VERIFY THIS. However I do know the
aircraft (hold F down then LOW) toggle does work.

From: LAIRDPG@lub001.lamar.edu
Subject: Re: TH28A mods? Anyone?

Date: Sun, 16 Aug 92 19:59:26 PDT

TH28A Mods:

1) Remove the 4 screws holding the radio together.
2) With your finger in the battery bay, separate the two parts.
3) The inside of the keypad case has a copper RF shield. Move this shield
out of the way by removing the 2 screws and bending it up and away from
the PC board. (There may be double sticky tape holding the shield to
the IC.) Under the shield you will find a large IC surrounded by
an array of diodes, as follows:



```
1 1 1 1
5 4 3 2

D D D D
1 1 9 8
1 0
```

(The diode numbers are read vertically.)

NOTE: Diodes D15 & D14 are NOT present in the American version.

4) Remove diodes D8 and D10.
5) Install one of these diodes in D14.

This enables the following three extended modes:

1) Extended receive from 360 Mhz to 400 Mhz.
2) Extended receive from 400 Mhz to 520 Mhz.
3) Extended transmit/receive from 136 Mhz to 174 Mhz.

in addition to the existing aircraft frequencies of:

4) Receive from 118 Mhz to 136 Mhz. (AM)

(AM and FM are switched automatically according to the frequency range.)

To switch between the modes, press the [F] key for one second, then
press the [LOW] key. This will switch between:
a) Amateur VHF band (136 Mhz to 174 Mhz).
b) 340 Mhz band (340 Mhz to 400 Mhz).
c) Aircraft band (118 Mhz to 136 Mhz).

To get the extended amateur UHF receive, press the [BAND] key while in the
136 Mhz to 174 Mhz mode.

WNDU-AM/FM/TV South Bend, IN | Disclaimer "My opinions are not my employers"
- "Busy life, not enough time to look in the mirror." - Deborah Ann Gibson -

****
END OF ORIGINAL MOD
****

Here is how I did it.

On the same circuit board that was described above, you will find 2 green
jumper wires. On the circuit board, they connect at locations labeled
"W1" and "W2". To perform the extended receive and out-of-band transmit
mods, simply CUT both of the wires. Tape the ends of the wires (to
avoid possible shorting if they move around) and reassemble the unit.

Much easier than trying to desolder and resolder surface-mount diodes, eh?

I take no responsibility if this modification changes the performance of your TH28A in any way, including increased intermod, birdies or flat-out failure of the unit. NOTE: PERFORMING THE MOD MAY VOID THE WARRANTY!!

hamilton on BIX (hamilton@BIX.com) wrote:

: If I were in your shoes, I think I'd do two things:

: First, I think I would assume that a 2M HT is not going to give you
: usable, reliable communication over a 50 mile distance (unless, as has
: been pointed out, your particular geography is quite unusual). So if
: you're going to get something working at all on 2m, you'll need something
: more like a 50W mobile unit powered off a 12V supply (e.g., one of the
: Astrons), feeding a beam. Fortunately, 2M antennas do not have to be
: all that large. Browsing the Ham Radio Outlet catelog, I see, e.g.,
: that a 4 element Cushcraft 124WB yagi (chosen at random, not as a
: particular recommendation) is only 3 lbs, and only 4 ft long, surely
: within your requirements.

: This still might or might not work. You'd probably just have to try
: it. The comments that 2M is more-or-less line-of-sight are correct,
: but as with many things, it can be more complicated than that. There's
: a lot of scatter also that may give you a path even if line-of-sight
: isn't possible.

: Anyway, this brings me to my second suggestion: see if you can find
: some local hams near you and your friend who can try the path for
: you with equipment that seems roughly similar to what you'd consider
: buying. This shouldn't be hard. EVERYONE these days seems to have
: 2M gear. If you don't know any local hams, call the ARRL and ask for
: a list of local clubs; go and meet people there. At most club meetings,
: you're invited to stand up and give any announcements you like and so
: certainly, you could explain what you're trying to do and ask for some
: help. Actually, I suppose you might even find out by experimentation
: this way that 2M HT's WILL work in your location! Who knows? But
: you should be able to get some free help to try things out, this way.

: Other random commments: Don't worry about clogging a repeater with
: idle chatter. Unless the hams in your area are a whole lot different
: than everywhere else in the world, that's most of what you'll hear on
: most repeaters most of the time anyway. Your chatter can't be that
: much more idle than everyone else's, I'd guess. :-) Just be sensitive
: (as you should be anyway) to give other folks a chance to get in
: and to stay off the repeater if you hear a net come on (unless you're
: participating) or if there is some priority traffic.

: Regardless of whether a 2M HT is going to make the 50 mi path to another
: HT, you may want one anyway. Most hams can't resist these "toys". They're
: a lot of fun and that's a lot of what a hobby should be about. So worst
: case might be that you each buy the HT's, you discover you do have to

: go via the repeater (okay, you can do that) but you decide (especially
: after getting them) that they're a lot of fun for talking with a lot of
: other hams also.

: Regards,
: Doug Hamilton KD1UJ hamilton@bix.com Ph 508-358-5715 FAX 508-358-1113
: Hamilton Laboratories, 13 Old Farm Road, Wayland, MA 01778-3117, USA

Doug you sure have a great way with words. Wonderful to see someone who really has the true spirit of ham radio...no FLAMES. Are you on packet? I would have considered suggesting 6 Meters...but the cost may still be a bit prohibitive for some. Especially buying new equipment out of the box. I am currently a no-code tech...who has found the wonderful new world of 6 meters. (I am also studying my code...for upgrade purposes.)

I just couldn't resist telling you how very refreshing your helpful ideas are to an obviously new ham. THANKS...hope I see you around in the near future.

>Has anyone whipped this problem??

I did my own mod consisting of connecting the fuel pump ground wire
(the black one) to frame through a braided strap and adding two
Radio Shack clamp-on ferrite beads.

This brought the noise level down to where it doesn't register
on the S meter although it is still audible on the lower bands
(80 and 40).

I am in the process of purchasing a IC-W2A and would like to
hear from people who have own this radio in the past or now.
The questions I would like to see are: Do you like this radio?
What have been some of the strenghts? weaknesses? What freqs.
can you receive? what is the quality of the receive? sensitivity?
etc. what mods are available for this radio (which are not located
in ftp.cs.buffalo.edu)

Thanks,
John T.

>sorry for being unknowledgeable.

This has been discussed a few times here. It depends on your ability to take the radio apart and put it back together. There are many wires and ribbon cables to watch. If your lot is around 21 or higher (I think that is the start point), there should be a green wire on the pads you need to cut. It is about 3 inches long, so it is not hard to find. Sliding the radio back together can be a bit tricky - take your time. There is a reset and reprogramming procedure after removing the wire. The reset needs to be done twice, not once as listed in most literature. I don't think Yaesu will make the mod due to legal considerations. There are several ads in the magazines by people who perform mods. However, I think $60 to $120 to cut one wire is a bit much.

Hi,

I have two FT411E's, one has a frequency range of
130MHz - 174MHz, the other one has
140MHz - 174MHz ...

Somebody told me you could reprogram the frequency ranges
by holding down a key while switching the unit on ??

Does anybody have any info on this ?

Thx,
XW.

Well, it's a shame that there's nothing about this in the manual I
got with the radio! Now, since I've not been doing this, can you tell
me what symptoms I'd have if I have zapped the Zeners?

OAN...
Also, everyone is always posting about the great intermod resistance
of this radio. While IF imaging is not the same as intermod, I _would_
like to say that I can regularly recieve the local University's
FM station at its image frequency. This is the _only_ problem I've
had with mine, and I like the unit very much. I just avoid listening
to that particular frequency and all's ok. :-)

>
American models of FT-26 need to have a jumper pad soldered across.
I believe it's #12 but I'm not sure. Call Yaesu at 301-404-2700 to confirm.
When performed correctly a 1750hz Tone Burst is accessable thru the push
of the "Monitor" button.
There is also a mod for out of band receive from 135 - 174 Mhz. If you have
a fax you could probably get both Mods.

Good luck

>
On production run 24 and higher (2nd and 3rd digit of serial no.) there is a lime green wire accessable by removing the 4 screws holding the battery cap on. After removing the cap with the speaker facing up you can see the lime green wire at the top. You may need to fish it out to access it. Cut it and your done. To reset radio push both arrow keys and turn radio on. Yaesu documentation does not state to reset twice.

By the way if you have production run 23 or lower you have to open up the radio and remove the soldier from jumper pad 13. Later production runs put the lime green wire there to ease modification. Yaesu, making it easier for the fellow ham.

Generally speaking, RipOff Shack doesn't care much for quality. The last HT they made had a plastic case (bad news if you drop it) and such poor audio drivers that the radio was absolutely unuseable inside a car, even with the windows UP! About the only thing you ever get to say in a mobile QSO is "Could you repeat that entire transmission? I didn't get a word of it?"

Here's hoping the 202 is better. Why don't you give us some feedback about 30 days after your warranty runs out?

How many VHF amateur HTs has Tandy offered?

>Now we know what kind of radio he sells, wonder what kind he *uses* ?

I've used an HTX-202. It was a pretty good, basic piece of gear. The
receiver performance was rated highly in the ARRL comparison last year.

If you want to just pick on Radio Shack, go to alt.flame.

4406. Radio Shack HTX-202: Good Buy

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-21 00:03:00 UTC
From: clint.bradford@ectech.com
Message-ID: <940923001142588@ectech.com>
Source record: 224070

>Did I get a get deal for this unit, and is this a
>fairly decent unit.

The HTX-202 is an EXCELLENT unit! Anyone who tells you differently
doesn't know what they are talking about.

Pretty? No.
Sub-miniature? No.
5,000 Channels? No.
Workhorse that delivers as promised? ABSOLUTELY!

The HTX-202 has 12 independently-programmable memory channels, plus one
calling and three priority channels. It comes with continuous tone
squelch encode -AND- decode. Power output is 5 watts minimum (7w
typical) with 12 VDC supply, 3 watts @ 9 VDC or 2 watts @ 7.5 VDC. Low
power setting provides 1 watt output. A power saver circuit with
programmable 1/2, 1/4, 1/8, or 1/16-second duty cycle. Batteries are
compatible with larger ICOM (IC-2AT/IC-32AT) series HTs.

Repeater offset can be adjusted from 0 to 4 MHz in steps as set by the
scan frequency step selection (5, 10, 20, 25, 50 or 100 KHz). Memories
store any offset, and any combination of continuous tone frequencies.

* True FM modulation (not phase modulation) for outstanding
transmit audio and best performance in packet service.
* Continuous tone squelch transmit and receive tones are
independently programmable.
* In addition to DTMF dialing, there is 5-digit DTMF selective
paging (DTMF squelch).
* A five-number memory dialer that stores 15-digit sequences
for autopatch use or DTMF paging.
* Scan for either active -- or vacant -- channels, with
programmable scanning step of 5, 10, 20, 25, 50 or 100 KHz,
and upper and lower scan limits (for VFO scan.)
* FAST, 25 channels/second scanning.
* Selectable priority channel scan interval, every 4, 8, 12 or
16 seconds.
* Multi-function scanning lets you scan standard memories,
priority freq. memories, or a frequency range. Resume can be
after 10 seconds, when carrier drops, or remain on channel
(don't resume.)
* Transmit timeout - if you frequently time-out your local
repeater, this circuit will stop transmitting after a preset
delay (30, 60 or 120 sec.) and sound a beep. In effect, it
forces you to reset the repeater before the repeater times out.
Of course you can disable the timeout circuit.

* The HTX-202 carries a 1-year parts and labor warranty.

Subjectively, this HT has exceptionally strong, un-distorted receive audio you'll really appreciate when walking around the local (noisy) hamfest. You won't believe the sound is coming from an HT! Transmit audio is crisp, clear and strong.

I put a 5/8-wave mag mount on my car, and used the 202 in the very intermod-rich downtown Ft. Worth, TX area. I've never been able to use an HT on an outside antenna within 2 miles of down-town Ft. Worth before. This one performed magnificently. My ICOM 2400 dual-band mobile gets less intermod than any other radio I've used in this environment, and the HT stayed with it, toe-to-toe. When the ICOM heard intermod, the 202 heard it, but when the ICOM was quiet, SO WAS THE HT!!!!

Even more impressive, the HTX-202 heard signals through the intermod, when the IC-2400 could not pull 'em out! Reason is probably because we purposely limited coverage to ham band ONLY! It can't be modified for out-of-band receive. The design objective was to build a specialized ham radio product that does the best possible job on the ham bands, and that includes the tightest, most intermod-free front end we could design into an HT! The published spec says intermod attenuation is 60db minimum. Spurious response and adjacent channel rejection are also 60db.

The HTX-202 is based on the ICOM 02AT with certain design modifications based on Tandy's specs. These variations include the encode/decode, additional memories, and a full width LCD display. Contrary to rumor, no part of the radio is Kenwood or Yaesu! ICOM sold the rights to their design to Tandy to do with what they would.

Whan Tandy sought to produce the unit, they went to their usual Korean source for cheap gadgetry: MAXON. Maxon then built the HTX-202 for Tandy, under license from Icom. The HTX-202 is surprisingly sturdy, and well constructed, considering that Maxon's Quality Control has, in the past, been suspect.

4407. Coming down hard?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-21 00:18:09 UTC
From: Tim_Coad@smtp.ESI.COM
Message-ID: <n1432040797.97684@smtp.esl.com>
Source record: 224128

9/20/94 4:30 PM

Regarding the ham fest thing:
Why are we coming down so hard on MQH?
I would let the score stand as is, and make the rule more specific.
As a VHF contester out here in the west, its very frustrating knowing theres about 20,000 contacts out there in range if those guys with their hand helds would just get off their repeater, or 52 for that matter.
Its very tough getting those hand held guys to go anywhere except to their favorite repeater. Giving these guys a little exposure to contesting at ham fests might in the long run improve rates for all. Dont get me wrong though, the hamfest hams should have been allowed to work anybody that called them back. And I for one would not want my call on a big sign that says "PLEASE WORK ME". But I can easily see where others might try it.

BUT IF IT TRUTH BE TOLD: FM contesting stinks big time anyway. Unlike VHF SSB contacts.
For example a typical 2 mtr FM exchange:

Contester:
CQ CONTEST, CQ THE ARRL VHF CONTEST, THIS IS K6xxx, K6xxx LOOKING FOR ANY CONTACT. YOU DONT HAVE TO BE IN THE CONTEST TO WORK ME. K6xxx QRZ.
hand held guy:
Ahhh K6xxx, K6xxx, this is (for example only) WD6DBT. (No phonetics)
Contester:
WD6EEE, THANKS FOR THE CALL. UR 59 in CM97. GO AHEAD.
Hand held guy:
Oh ok. Gee I didnt realize there was a contest on, I was just.... (1 min narrative of the morning activities) ....and just turned this thing on and there you were....name here is .....and ahh youre full quieting in Livermore.
K6 oh now what was your call, didnt write it down.....go ahead from WD6DBT.
CONTESTER: OK THANKS CALL HERE WAS K6xxx. BUT IM NOT SURE OF YOURS, CAN YOU USE PHONETICS?
Hand held guy: Sure, call here is Whiskey Delta 6 D-B-T.
CONTESTER: OK WD6DDE. STILL NOT SURE OF YOUR CALL, AND I NEED YOUR GRID SQUARE.
Hand held guy: We are in Livermore. Not sure what grid square that is. Hope that helps you out. Call here is W-D-6-D-B-T, D-B-T, Dango, Bango, Tango, go ahead.
CONTESTER: WD6DBT, QSL YOUR GRID AS CM97. 73'S AND THANKS FOR THE CONTACT. QRZ CONTEST, K6xxx.

Now after 900 contacts like that, somebody deserves an award, dont you think?
Tim - NU6S

Ne> hear from people who have own this radio in the past or now.
Ne> The questions I would like to see are: Do you like this radio?

Hi, John. I've had a W2A for about 3 years now. I like mine a lot, although it had to go back to Icom several times during warranty for minor annoyances, and once out-of-warranty for what turned out to be a broken BNC connector (dropped, landed on antenna, got noisy).

Ne> What have been some of the strenghts?

Small size (though there are smaller), most of the really useful functions and a few useless ones, fair number of memories (30/band). Not the worst on the market for intermod. Good 800 MHz reception.

Ne> weaknesses?

Small speaker, so no "room-filling" sound. Sealed battery, so hard to replace just cells. Hard to find power connector (available only from Icom). VHF volume/squelch knobs hard to turn because they're crammed up agains the antenna. Can't turn any controls with slippery fingers. Easy to accidently push some front panel buttons (I keep turning on the "priority" feature). Does not receive two freqs in same band (a new feature on the newer radios -- this one's getting "old"). Low mic gain -- gotta talk right up to it, and not be mush-mouth.

Also, in this area we have two TV stations exactly 26 MHz apart, and the radio has a 26 MHz IF on UHF. I heard TV sync buzz everywhere outside the ham bands. Icom modified the radio to keep the narrower ham-band UHF front-end filter in line even when the radio was tuned outside the band. I lost some 300 and 500 MHz coverage (not too sensitive there anyway). Still good sensitivity up to 470 MHz, and no buzz.

Ne> What freqs.
Ne> can you receive? what is the quality of the receive? sensitivity?

118-180 MHz, 430-470 MHz, 800-900 Mhz with decent sensitivity. It actually tunes almost continuously from 118 to 1000 MHz, but in most of the other areas it's pretty deaf (even without the UHF receive mod). Prone to intermod, especially with an external antenna in high RF areas, but no worse than others. Small speaker.

Ne> etc. what mods are available for this radio (which are not located
Ne> in ftp.cs.buffalo.edu)

Besides that UHF receive mod (which you may not need, but which does actually improve UHF commercial-band sensitivity a bit), the only

one I know if is adding a couple of "three-terminal diodes" to the motherboard. These are surface-mount devices, but the board is not that hard to reach, if you're competent in surface-mount soldering. This lets you transmit from 118 to about 170 MHz and 420-470 MHz.

Ne> Hello all, this is a question to all of you who have Vox headsets for
Ne> your 2meter HT's. I own a (what else) HTX-202 from Radio Shackand I
Ne> was wondering if I could connect a headset to it. Having only 1 ear
Ne> piece would be the optimum. Does any one know which brands will work?
Ne> If so where can I get them and how much $$?

Ne> Thanks in advance. Jason N1RWY

Icom accessories work with the 202. Select the Icom stuff designed
for the 2AT. They have a headset with single ear"bud" type earphone.
The cost about $60, and are not very sturdy, but they work well.

I have one for my Icom W2A. I find the VOX not very useful, cuz I
don't always want what I say transmitted, but in some special circumstances
it could be useful.

4418. HT Comparisons?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-22 02:48:00 UTC
From: clint.bradford@ectech.com
Message-ID: <940923001142589@ectech.com>
Source record: 224071

C>Newbie question: Is there any comparison articles (like Consumer
>Reports) that match up a large number of HT's, like the HTX-202...

The problem, of course, is that new models come out all the time,
negating a "Ratings" listing.

I have found that the best "reviews" come from a combination of (a)
knowing what you need (meaning: Join your local Amateur club, see
what is available locally as far as repeaters, packet, or whatever you
want to do with Amateur Radio), and (b) seeing what equipment is being
used locally, by those who have similar interests as yourself.

After doing my "homework" I discovered that my HT purchase/needs was
quite different than many. I found out that a 220 unit would be of great
use to me - for what -I- am doing with Amateur Radio. I have two
autopatch systems at my disposal now, as well as a Statewide net
(CONDOR) that is available for travelling.

I mention this ONLY because
if I had purchased equipment using the suggestions obtained with a
"What's the best HT available?" question, I would (a) own a great 2m/440
HT, but (b) not be using it much!!! (That's over-simplified, but I think
you get my point. And, of course, the best 220 HT is the Standard
C288a.)

Hello,

Having recently bought a new Nissan Pathfinder, and a Yaesu FT-5100 to put in it, I now have the pleasant task of drilling a hole to place the antenna on the roof. However, my Larsen NMO-K mount says I need a 3/4" hole, and my largest drill bit is 1/2". I have hole saws available, but they are toothed for wood, and I don't want to try that out on my new car.

What I need is a suggestion for making the hole large enough. Are there special drill bits available for this task, or do I need some kind of sheet-metal punch only available at a radio installer's shop? Any suggestions would be helpful.

Get a bit called a "Versabit" or "Varibit" ...some such name. What it is
....is a stepped bit with hole sizes 1/16 or 1/8 apart. They come in
several ranges, and are somewhat expensive at about $25 or so. However,
they are nice to have for future projects, and are very high quality.

Brave chap !

I have the same task ahead, on my new land-rover, after L-R come up
with the precautions guide regarding airbags and ABS.

3/4 drills with 1/2 stems are available, but big drills do tend to
tear sheet metal.

Look for a "tapered reamer" a simple hand operated hole enlarger. I
use one gripped in a joiner's brace. Gives a lot more control than
big power drills.

Another alternative is to open out a 1/2" hole using a round file.
It's not much work. If filing or reaming, you'll need to be sure you
have enough room inside to for the tool.

Cover the car's paintwork for a ridiculous distance around the site
of your operations with thick adhesive tape. It's amazing how far any
cutting tool will skate to be sure of making a really good scratch. A
little silicone grease on the soft washer that seals the mount seems to
be needed to survive Scottish rain conditions without leaking.

As I have rather a tall vehicle, I use an antenna mounted within
reach via the driver's window, so I can tilt it over for car parks etc.
mine is fitted right over the swivel mounting for the sun visor so that
I don't need to drop the whole roof trim should I need access from below
to tighten or re-seal it.

I chose an antenna mount that also takes a cellphone element, and
kept one ready to screw on when I sold the old L-R. Holes in car roofs
seem to be quite acceptable when plugged this way ;-)

Cheers
David GM4ZNX

Get yourself a "Greenlee Knockout punch". This is a two piece punch
which is drawn together with a 3/8" bolt. You drill a 3/8" pilot hole,
then assemble the punch on both sides of the metal panel, and tighten
the bolt. As the bolt draws the two parts of the punch together, it
shears a very nice hole, even thru steel.

These are available at major industrial electronics distributors, or
industrial tool distributors. You may be able to borrow one from a
commercial electrician. They use them to install conduit fittings
thought the side wall of an electrical panel (if it wasn't
prepunched). Methinks that the hole made by a knockout punch for
1/2"conduit is very close to 3/4" in diameter.

Riyadth-

You got it! Some hams who build a lot of their own gear may have a collection. Check around for someone who will loan you their 3/4 inch "chassis punch". One company that used to make them, was Greenlee. However, they may have been bought by another company a few years back.

For the ones I'm familiar with, you have to be able to get to both sides of the metal. A small hole is drilled for the punch's bolt. The punch and die are assembled as a sandwich with the roof metal in the middle. A wrench is used to tighten the bolt, until the punch and die are drawn together through the roof metal.

I also have a Nissan Pathfinder, and have mounted an antenna on the roof. You need a chassis punch of the desired size. It will make a nice clean hole. They are available from large electronic parts dealers. Take out the dome light and you can get the access you need. I ran my coax down thru the post between the driver`s door and the windshield.

I recently installed a mobile antenna in my new (relatively) Ford Ranger. I purchased a 3/4" hole saw at the hardware store (I think Sears has one, too) that works on a variety of materials, including metal. I don't know what the name of it is offhand, but it worked nicely. I think the saw and the mandrel cost approx. $7-$9 together, but it was worth the price to do the job neatly and quickly.

Get a 'Bi-Metal' hole-saw bit, available at most hardware stores, slightly more expensive than wood hole-saw bits. Many brands available, I've been happy with DeWalt, but I'm sure any one of them will do a good job.

They actuall make a special drill bit for mounting the NMO antenna
mount. Check with the local Motorola MSO they should have one. You
might be able to get them to pop the hole in the roof. Other wise use a
3/4" chassis punch or pick up a "Unibit" these are available in a 3/8"
shaft. They start at about 1/4" diamater and progress in steps to 3/4"

4432. AM Sensitivity Problem with TM-241A ??

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-22 19:23:57 UTC
From: deane.r.charlson@gsfc.nasa.gov
Message-ID: <deane.r.charlson-220994152148@botanybay.gsfc.nasa.gov>
Source record: 224049

I've got two Kenwood TM-241A 2m transceivers. I've had one for several years now and use it regularly for AM receive. I'm happy with it. I just bought another one and it can barely pick up anything on AM. The two rigs definitely have two different sensitivity levels when it comes to AM. FM works fine on both rigs. Has anyone else experienced this type of problem?

The subject says it all. I an cleaning up a friends IC-211A ICOM 2 meter Multimode base station and could use the above manuals . A copy of the schematic as well would be great.
I'll pay shipping and reproduction costs.

well... i'm in the midst of this too... and the old units used 110vac
instead of the current 24vdc... so your receiver may also need a
24 v supply.
i just bought a genie trans/recv set at Home Depot ($36?) ... but they
didn't stock the power supply.
if you dial 1-800-ok-genie they'll supply the name/number of local
nuts-and-bolts vendors of these things. one i tried said it was $50
for the trans/recvr set, plus about $24 for the power supply.

the genie set does *not* come with schematics, but they do list the wire
colors/functions.

4435. Fast charging FT530 batteries?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-22 22:17:47 UTC
From: tom.baker@nfe.com
Message-ID: <940922230542265@nfe.com>
Source record: 224056

-> Does anyone know some of the technical details of the Yaesu 1-hr fast
-> charger for FT530 battery packs? I'm a new ham, with a new radio,
-> but I also have some experience with RC Cars, and have a peak-voltage
-> detecting fast charger which I use with 7.2v 1300-1700mah nicad packs
-> I'm wondering if I can rig an adapter to use this on my Yaesu standar
-> battery pack, and what problems I might encounter.
Well, I don't know the Yeasu packs myself, but I can pretty much layout
some info for you. You WILL be able to fast charge them, BUT, you will
get shorter run time, and the batteries overall life will decrease.
Now, if you have a specially designed battery, like in RC (which I do
myself also), which has better ventilation, and is in general sturdier,
they will last a lot better. In general, if you have the time for an
overnight charge, with ANY NiCad battery, the battery will be better
off. But, if you don't have the time, a 1 hour charge will work. BTW, I
doubt ANY of the HT's batteries are designed for quick charging, they
just "will work".
-> I'd also need inputs as to the charging current to use for the 600mah
-> battery. I'm guessing that probably a 600-800ma current is about
-> right to match the "1-hr" charge time.
Well, for a 600mah pack, I'd say about 1 amp, for 1 hour. Since, with a
quicker charge, there is a greater loss of energy. One way to check is
feel the battery. If it is warm before the 1 hour, decrease the current.
-> Finally, the charger has a linear and a pulse mode, and I'm not sure
-> which is more appropriate for the type of nicads in the Yaesu pack.
-> Charger documentation says use linear for "SCE" type, and
-> pulsed for "SCR" and "SCRC" types. Any help here?
You can use either mode for either battery type. Pulse charging is
better for older batteries, for new ones it doesn't matter much. Pulse,
IMHO, is better all around.
Later

I can save you some money too... Call up Ray's Amateur Electronics in High Point, NC and order, for the same $200.00 that you would have spent on a Radio Shack, an Alinco DJ180T: It has extended Receive, the same amount of memories (expandable up to 200 Memories) as the RS HT, and is considerably smaller. It comes with belt clip, Nicad battery, and desk charger. Not a bad little HT at all. And plus, you don't have to worry about hiring a pack mule to carry it whenever you go out of the house....It is small and light. Ray's number is 1-800-845-5338

The TM-241 has recently been reworked to reduce intermod problems.
Serial Nos. 50800000 and later are the new ones. I suspect that some
of the intermod reduction came thru reduced sensitivity outside of 2m.

Here are two options:
i) Greenlee 3/4" socket punch. Available from Mouser Electronics for
about $15 or so. You need to first make a 3/8" hole, place one
piece under the sheet metal, one over and then use a wrench to draw
the pieces togehter to punch a very clean 3/4" hole.
ii) A special hole designed for this purpose. It has teeth for sheet
metal and a plastic covering on the saw that prevents a cut depth
of more than 1/8". Saves the headliner. This is probably the best
tool for this job. Single step, done from just the top of the roof
and safe. The quality is not as clean as the punched hole but it is good
enough. Larsen used to sell this. I suspect it is available in
professional tool catalogs as 2-way radio shops have them.

4444. RE: cutting 3/4 hole for antenna

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-23 13:50:33 UTC
From: johnp@ipctech.com
Message-ID: <johnp-2309940850330001@shipping.ipctech.com>
Source record: 224058

Do yourself a favor and purchase a 3/4" hole punch. Greenlee makes one. Jensen tools used to sell them, 800-426-1194. If they dont have them, most any electrical supply house should. To use the punch, you drill a small pilot hole in the metal, then attach one half of the punch on either side of the pilot hole, held together by a small bolt which runs through the pilot hole. When you tighten the bolt on the outside of the vehicle, the two parts of the punch are pulled together and it cuts a perfect 3/4" hole. I paid about $27 for mine, which at the time I thought was steep but after using it the first time, I was more than pleased with my investment. Besides the other alternatives, ie drilling a smaller hole and finishing up with a bastardization bit or using a hole saw, both of which are risky and sloppy. I would get the punch. john KO4MY

The safest, neatest way to make a hole is with a sheet metal punch.
The most common ones available are made by Greenlee, I think. If you
go to an electrical supply store and ask for a "Greenlee punch" - of the
appropriate diameter, you will be given the right thing. Better yet,
borrow one from somebody who has access to a machine shop. It works like
this: you drill a small hole (say, half inch) and then slip the punch
bolt thru the hole and tighten it with a wrench until it does its
cookie-cutter thing. BUT -- this is possible only if you have access
to both sides of the metal you are cutting. I dropped the dome lite
inside my '92 Escort wagon to install the NMO mount for my Austin 500C
antenna. Piece of cake.

Ken...
In September QST there is an article regarding this exact problem. The article refers to a Ford service bulletin (I can't recall the exact number but its there). As a matter of fact, my '93 Bronco (full Size) has the same problem which my dealer will be repairing (at the expense of Ford) this Monday. The only catch is the vehicle has to be under warranty. If this posting is still present Tuesday, I'll write back on the results. Evidently they have to pull the tank and fuel pump, cut the leads, install a commercial filter (abt $75.00) and button it back up. I'll be in touch...

Source record: 224065

Just got off the phone with a very nice TenTec engineer
and we were talking about the 1208 xverter and the prob's
with its production. Here's the low down:

Manuals are at the printer and will be in next Tuesday.
He said they expect to have kits ready to be out the
door toward the end of NEXT WEEK!!!!

Operational note:
Why only good from 50-52 MHz? Why Why WHY???
Apparently the products are within Part 97 specs
from 50-52 MHz. Beyond 52 MHz, the other mixing
products aren't down below what's required by
part 97 regs. The xverter WILL work up at 54 MHz,
but it violates the FCC regs, so it is NOT intended
for use up there.

Oooh, can't wait. If you ordered one today, it'd be
on your doorstep in about 3-4 weeks. the current back-
log is about 2-1/2 weeks.

Larsen suggests a hole saw, and has one with a limited depth of cut so
that you'll cut the metal, but not the headliner.
HOWEVER, I used a hole saw, and the hot metal chips melted into the
clear-coat, and are embedded there. If I were doing it again, I'd
take out the headliner completely, and use a chassis punch. Whichever
way you do it, make sure that the mount gets a good ground to the
sheet metal.

4456. Motorola Sabre HELP

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-23 22:29:00 UTC
From: w5robert@blkbox.COM
Message-ID: <9409231729.aa09960@blkbox.COM>
Source record: 224082

Harold, sri I can not see your internet address, hence I can
not reply directly. The Saber has PC programming software.
It also requires a Motorola interface for PC to radio. This
interface can be used for many of the Motorola radios/repeaters
etc. The software / interface are not "freebies" from Motorola.
Also, considering the cost of the Saber - that seems a strange
choice for a ham rig, and it only covers one band and proably not
on the ham band without a MOD of some type. Do you have that MOD?

Thanks to all for the great suggestions! I'm happy to report that I was able to borrow a Greenlee punch, and with the dome light out and the headliner loosened, the job was a piece of cake.

It seems that there are many solutions to the problem, and even the course-toothed hole saw will work satisfactorily, according to many responses. I was very happy to see all-positive responses to roof-mounting the antenna -- makes me feel better about drilling my new car :-)

Once again, thanks all!

What's is the deal with these mysterious mods I have been hearing about
on the Kenwood th-78a ?
There are many little things I heard can be done to the HT
I understand there is a crossband repeater in the unit too , where is it ?
Or is that a mod too ?
Can someone tell me any mods or where I can find any ?

Thanks Before Hand and 73

If installing NMO mounts will figure heavily in your hamming future, it
might pay to talk to your local 2-way radio (or cellphone) shop about
buying a Motorola antenna-installation drill bit. I don't believe that is
the right name for it, but that is what it is specifically made for.

It has a pilot of about 1/4", a 3/4" hole saw optimized for metal, and an
end mill of about 7/8" to remove the paint from the metal so the
coupling ring from the NMO mount will get a good ground. Cost (as I
remember from seeing one about 5 years ago) is around $14.00.

I wish I would have read all these responses before I drilled a hole in the roof of my Mazda 323. I used a regular 3/4" drill bit. Not a good idea... It tends to catch the sheet metal and tear it. Fortunately, when this started to occur, I just stopped drilling and broke out the Dremel tool. I just ground the rest of the hole with a stone type bit. It was more work but it left a clean hole. Anyway, take it easy!

From: philkeys@pt.olympus.net
Message-ID: <philkeys-2409940654440001@ptpm009.olympus.net>
Source record: 224091

Do modern HF and VHF/UHF tranceivers output the same RF power using 12 VDC as 13.8 VDC? i.e. is there a difference in output power in a mobile installation with engine turned on and charging (13.8 VDC) and engine turned off and running just on the battery (12.0 VDC)? Does this vary much according to transceiver model and manufacturer?

I considering buying HF and VHF/UHF rigs for operation on just battery power and don't want to lose much power at 12.0 VDC.

Thanks

Yes, the power varies, often quite a bit, depending on supply voltage. Most rigs are specified at 13.8 volts. Operation on 12 volts can drop output as much as half with some radios, and operation below 11 volts hardly ever works right (VCOs come unlocked, audio is distorted, etc). When you add in DC cable voltage drops, this can become quite serious. Since almost all of the radios will work at voltages up to 16 volts, using higher voltage batteries for portable use can be a good idea. You can get 8 and 14 volt lead-acid batteries intended for cold weather starting, and of course you can stack as many 2 volt Edison cells as you wish. This will give you much better margin as the cells discharge.

Most transmitters put out less power with lower supply voltage. Some
commercial rigs have an ALC (automatic power level control) circuit,
but most ham rigs don't have that.

On the other hand, the 1 volt or so difference between engine on and
engine off will generally affect power output by less than 1 dB,
so it's not really something to worry about.

4478. More notes on 3/4" Antenna Mounts

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-25 00:06:01 UTC
From: KKEYSEEA@UMUC.UMD.EDU
Message-ID: <362et9$497@nova.umd.edu>
Source record: 224000

I enjoyed all the comments regarding mounting antennas
using a 3/4" hole mount. Sure is a daunting task to perform on that
nice new car, isn't it?

I worked part-time in a professional radio shop for about
three years, and have installed hundreds of these and other type
mobile antennas. Let me give some pointers on what I've seen
happen during antenna installations.

1) Take time to look over the vehicle and choose a spot carefully.
There are tradeoffs: Performance, ease of installation, garage
clearance, coax runs, etc.

2) Performance. Center of the roof. For multiple antennas, lowest
band antenna near center, next higher band somewhat behind the first,
but both antennas along the side-to-side center line.

3) Ease of installation: Center of trunk lid. On-Glass. Cowl.
(in order of reduced performance) Center of roof is not that hard,
but takes longer.

4) Clearance. I use a center-roof 1/4 wave for routine ops given the
ease of handling my garage entry. If taking a long trip, I have a
5/8 wave that screws on the mount quickly. (GE 3/4" mount)

5) Coax runs. For the vast majority of installations, people use the
RG-58 coax that comes with the mount. Some mounts (GE) allow replace-
ment with another type of coax. RG-8X is easy and much better. I have
used double-shielded teflon coax (like that used in duplexors) to
prevent RFI with other sensitive devices. (It might help keep you
from frying the UNSHIELDED computers found in some imports) In one
UHF installation, I used mini-hardline. Obviously this is an
investment in time...

6) Type of mount. For some "rough" commercial customers, we started
them off with a 3/8" mount. If/when this was ripped out, we used a
Greenlee punch to mount a 3/4" replacement. If/when THIS was ripped
out, we used a reinforcing plate with a 3/4" hole underneath the mount.
I never saw one of these type installations ripped out.

7) Hole production. I would never use anything on my own vehicle
except a Greenlee punch. I've used a hole saw many times, though.
Commercial shops use them because the speed is much faster over the
punch method. You saw the hole, fish the coax down a column, and
install the mount; no headliner hassle. Skill, Skill, Skill, otherwise
you damage the roof and headliner.

Stories:

One installer in the shop had just bought a new car, and wanted to install a performance UHF antenna in the roof. He chose the quick method, that is, drill the hole from the top with a saw without investigating what's under the drilling area. The hole turned out to be over the center roof supporting beam. This required the total removal of the headliner and nibbling away part of the beam to allow room for the mount. What he thought would take five minutes took hours. Moral: At least remove the dome light or drop one side of the headliner to inspect the target area for the hole.

One officer in the local PD made us install his VHF antenna in the roof of his cruiser rather than the department-mandated center of the trunk lid. The change in performance was so startling that the department changed their policy. Simply put, he could reach the dispatcher when another car next to him couldn't be heard.

On-glass antennas. These are OK if you are not keeping the vehicle over 2 years or so, or don't want the hassle of a real installation. I had one for awhile, performance is fair at VHF. At UHF not so good. Especially cellular. Cellular dealers prefer them to keep installation costs low, and in most cases performance is adequate in metro areas where the cells are small. My cellular is 3/4" hole mounted in roof. Very little mobile flutter while moving, while others in same area with on-glass antennas drop calls.

I keep vehicles long enough that the hole mount doesn't impact the resale value. I have traded in with rubber hole plugs in the hole, or leaving the mount in. In most cases the dealer didn't even notice or care.

Oh, an trunk lid/groove mounts cause coax chewing within a year, so those are not highly recommended.

Hope these comments help your decision-making. If you go the center-roof hole mount, the performance is fantastic!

Date: 1994-09-25 01:13:41 UTC
From: finster@zeus.fasttax.com
Message-ID: <finster.291.2E84CEC5@zeus.fasttax.com>
Source record: 224001

I'm looking for any practical reviews of the above mentioned radio. How does it stand up to intermod? How many memories? What freq limits? Anything else I should know before I buy one?

Thanks in advance.....

finster@fasttax.com

Not entirely correct.

The HTX-202 is based on the ICOM 02AT with certain design
modifications based on Tandy's specs. These variations include
the encode/decode, additional memories, and a full width LCD
display. Contrary to rumor, no part of the radio is Kenwood or
Yaesu! ICOM sold the rights to their design to Tandy to do with
what they would.

Whan Tandy sought to produce the unit, they went to their usual
Korean source for cheap gadgetry: MAXON. Maxon then built the
HTX-202 for Tandy, under license from Icom. The HTX-202 is
surprisingly sturdy, and well constructed, considering that
Maxon's Quality Control has, in the past, been suspect.

4481. Fun with oscilloscopes

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-25 01:27:01 UTC
From: Kenneth.E.Harker@Dartmouth.Edu
Message-ID: <362jl5$cma@dartvax.dartmouth.edu>
Source record: 224002

A couple months back, I bought a Techtronix Type 502A scope with manual and probes for $10. Even though I do not currently have anything to use a scope for (as I have neither the money nor freetime to build stuff just yet) I got it on the basis that 1) I hope to eventually try building and testing stuff, and 2) when else am I going to find a working 1MHz bandwidth, dual trace oscilloscope for $10?? So, it was an investment.
In the meantime however, I have this large piece of metal-encased vacuum tubes in my dorm room. Rather than just let it sit there, I jumped on an idea of a physics grad student/fraternity brother of mine, and have hooked it up to my stereo. (Connect each probe to a short piece of wire plugged into the same speaker ports as the speaker wire goes into, and connect one of the probes' ground leads to the ground screw on the back of the receiver/amp. Make the upper sweep horizontal and the lower sweep vertical.)
So, now I get to see all the waveforms in the music, some of which form really cool patterns. And when I have my door open, the scope is visible from the hallway, so I get all sorts of attention. :-)

What I'm wondering is, are there any other "recreational" uses people have put their oscilloscopes to? Watching phone or modem traffic, maybe? Monitoring a SCSI bus?
Also, any ideas on how to lower the noise level of the fan without going to the trouble of replacing it?

4482. TH-79A: Strange mode found, what is it?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-25 02:06:22 UTC
From: cap2624@ultb.isc.rit.edu
Message-ID: <1994Sep25.020622.5040@ultb.isc.rit.edu>
Source record: 224003

I have read through the 79A mods doc which has been posted on this news group, however it does not mention the following mode which I have discovered. I do not know what it's purpous is.

Hold down BAND and turn the power ON. It is a "limited function" mode, where no frequencies are displayed, and manyfunctions become disabled. Check the Guide Function, it only contains THREE entrys now.

Could someone please determine a use for this function? Thanks!

Btw, to turn this mode off, do the same thing, hold down band and turn it on.

I have endlessly asked this question, and am again asking -

Does anyone know of any mods for the ICOM IC-3SAT 220HT?

I am primarily interested in expanded received.

If so, please post here and/or e-mail me direct.

Thanks much.

Scott

4484. Re: Radio Shack HTX-202: Good Buy

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-25 04:02:11 UTC
From: s2202629@np.ac.sg
Message-ID: <362so3$8kl@nova.np.ac.sg>
Source record: 224019

I'm trying to get a ham licence, and basically, my local regulations state that I must have equiptment (thats type-approved) before I can get a license.

I will be applying for a restricted (no code) license, and the following is a bit of the requirements the equipt must conform to:

The restricted class license permites the licencee to operate on the VHF bands allocated to the Amateur Service (144-146Mhz). The station shall transmit on F3E or A3E. The maximum RF output power allowed is 10 Watts (erp).

Should in the event the transciever can do 'more', it _must_ be modified by someone (presumably who manfuactured the unit), and (if I recall correctly) come accompanied with a letter stating the modifications done.

After which, the unit will be subject to test by my local authority (it'll cost me S$200), and _if_ it passes, I will be allowed to get a license.

As I'm getting started, I'd like to know what would be a good buy. I've read quite a bit about the Radio-Shack HTX-202 and would appericiate detailed information on the unit (please email me with it).

To keep costs low (ie, save on the need for a seperate pwr supply, an external antenna, and the paperwork (and costs) to install it on my apartment block), I was considering getting a handheld.

Could someone tell me what are things I should look out for, as this would be my first piece of radio equiptment. Pitfalls I should avoid, and what are things one find a good plus, or plain annoying in a rig.

I would also appericiate info (via email) where I can purchase the above RS model, and how can I get in touch with the people who sell it, do the necessarry modifications for me. How would payment be made, and how reliable thier services are (ie, if the modifications aren't properly done, it's $200 down the drain for me - not a very plus point on saving costs). Better yet, does anyone
know anywhere local to me (ie in Singapore) that deals with RadioShack's stuff?

Thanks.

PS: Does the Radio Shack HXT-202 have any brochures? Could someone perahaps be so nice as to convert it to a .FAX or something of that sort, and emailed me a copy? (Or perhaps send it snailmailed - email for my address).

4486. Re: TM731 KENWOOD Opinion

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-25 04:39:56 UTC
From: Scott Gamble <sgamble@delphi.com>
Message-ID: <ZO024mk.sgamble@delphi.com>
Source record: 224005

Greetings!
The TM-731 is an excellent radio. I am currently using the 144/222 version of the same radio (TM-631). Here are a couple of hints to check out on a used one:
1. The front panel controls are very flimsy, and tend to break and/or wear out easily. Make sure to check the operation of all of the buttons and switches BEFORE you purchase the radio. Pay particular attention to the slide pots for the MAIN/SUB balance and the SUB SQL. Their adjustment is particularly coarse, and seems to get worse with age.
2. Also, I have had 3 friends have the VOL/MAIN SQL knob fail. Two happened soon enough after purchasing the radios that the dealer replaced them, the other had to wait several months for Kenwood to ship him the replacement. It is on a small plug-in card that breaks very easily. I would recommend that if you use it for a mobile radio you treat it very carefully. I moved mine inside the shack for just that reason.

Don't let me frighten you with the two small items above. I think my TM-x31 is a great radio, and I'll hold onto it for quite a while. I get great audio reports and it is basically easy to use. Just be careful especially when purchasing a used one. Enjoy!

Very 73,

Scott

Actually, the 4XC250B is an RF beam tetrode; testing them as triodes is
guaranteed to produce wierd results :-)

I test used tubes by placing them in an amplifier circuit and testing for
RF power output, with the following voltages: Heater, 5.8V; Control Grid -65V;
Screen Grid 325V, Anode 2150V. And just because they produce so RF output,
that doesn't mean that they're any good! The IMD products from an apparently
'good' tube can be terrible.

Used Amperex tubes sell for $7.50 equivalent here in the UK.

Back when I was at Georgia Tech, we hooked up our kerosene fired scope to the Victrola and did this too. (Well maybe it wasn't *quite* that long ago, but the Tek 545 was current production.) Anyway, one of the games we played was trying to identify the songs by *only* looking at the scope. Turned out to be pretty easy for a lot of songs. You could also spot which songs were done in which studios, and which engineer mixed them, just by watching the scope.

We also hooked up the outputs of our (analog) computers to the scope and did computer "art". A couple of A/D converters could let you do that with today's digital computers. Vector graphics doesn't suffer from pixel jaggies like raster scan graphics does. You can get pretty good wireframe drawings that look like they were done with pen and ink.

4490. SOLAR POWER AM/FM Radio

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-25 12:26:15 UTC
From: natlimp@primenet.com
Message-ID: <natlimp.24.0087B891@primenet.com>
Source record: 224017

I found a GREAT GIFT ITEM, especially if you or someone special like(s) unique gadgets and conversation pieces. It's an AM/FM radio that ELIMINATES THE NEED FOR BATTERIES OR ELECTRIC! I just turn it on, hand it to friends, and show them the empty battery compartment. That usually prompts some interesting questions! It's SOLAR POWERED, with a RESERVE BACKUP STORAGE CAPACITY, so it RUNS IN THE DARK, TOO. And if that runs down, IT HAS ITS OWN INTERNAL GENERATOR which recharges the cells. I've kept it on for days at a time, even ALL night (in the dark), and it has never gone dead. It has a place for batteries, if you like, but I've never put any in it. It comes with a carrying strap --and of course, NO BATTERIES, BECAUSE YOU'LL NEVER NEED THEM! Take your part in cleaning up the environment by eliminating battery waste, and COSTS.

This is the coolest thing for the person who THINKS they have everything! The unit measures 3" X 6", has a black case, and is valued at $49.95. AS AN INTRODUCTORY SPECIAL PROMOTION, A LIMITED QUANTITY HAVE BEEN SET ASIDE TO SELL AT $24.95 (US$), plus $3.50 (US$) shipping/handling (total $28.45 US$). (Arizona residents, add sales tax for a total of $30.39). International customers, your total is $33.45 (US$).

YOU MUST BE COMPLETELY SATISFIED, or return it within 30 days for a FULL REFUND(less shipping). If you want your order RUSH shipped via overnight air within domestic USA, add $17.50 (US$) to your total.

This is a receiver only, and does not transmit, but it is a radio!

Send check or money order to:

NATIONAL IMPRESSIONS CORPORATION
1710 EAST INDIAN SCHOOL RD. SUITE# 205
PHOENIX, ARIZONA 85016 USA

(A Dun and Bradstreet rated company, celebrating our 10th year!)

Orders shipped immediately upon check clearance! Enjoy!

>deeper and find out what will work!

Hi Clint, the third connection on the 3-connection sub-mini MIC plug is
voltage through a 100 ohm resistor on the ICOM and Alinco HT's. It
is used to power the VOX electronics, and anything else that needs power.
Plugging a 3-connection plug into a 2-connection socket will not supply the
necessary voltage. Conversely, plugging a 2-connection plug into a
3-connection socket will drain the battery.

4496. HT problem--help!!! Please!!!

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-25 19:08:19 UTC
From: jlw3@ritz.cec.wustl.edu
Message-ID: <364hr3$shc@ritz.cec.wustl.edu>
Source record: 224015
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I need some help here. I have an Icom W21AT whose external power jack no longer works. The HT works just fine by battery but does not power up when the external power is plugged in. I know that the adapter is ok. I know that the problem is with the HT. Anybody out there ever had problems with the external power jack failing? Anybody out there have suggestions on what I might look at?

What happened? The ht sustained a 4 foot fall onto carpet (it was also in it's little soft case). The radio was fine, but the tone card inside was kinda jarred loose. So I took the radio apart (via instruction manual instructions. However, although I turned off the power, I didn't disconnect the power cord. While removing the metal battery lead, I apparently shorted the battery terminal.

I found nothing to smell fried, and saw nothing unusually brown or black. Is this beyond simple search and repair? I'm having the schematics sent to me from home.

Thanks in advance for any help!!

The extended receive can really be a detriment if you are in areas that
are prone to a lot of intermod... The HTX-202 is a really nice unit if
all you want is a 2-meter rig. The fact that it has a limited receive
is to it's advantage when it comes to rejecting spurious emissions from
other freqs... But I wish I could upgrade it to 200 memories. ;)
(BTW: It comes with belt clip, nicad bat, desk charger, as well as an
adapter to utilize alkaline cells also)

I've become very interested in how to provide the best ground and lightning protection for my station. I am living in my fraternity this year, and would very much not like to see it get fried because of my amateur radio activities.
First, my situation: 2m/70cm base station vertical, chimney mounted on top of a three-story building, tip probably 15m above ground. Station is a vhf/uhf handheld, dc power supply, macintosh system, and tnc inside my second floor room. Coax entry will be through my window. Soon to acquire a 10m rig for same power supply, which will use a dipole, and the same coax entry.
I've acquired and read Roger Block's _The "Grounds" For Lightning and EMP Protection_. I perfectly understand now how, if I had a commercial tower, equipment hut, and $1K to spend on a ground system, I would best do it. I understand the benefits of a perimeter ground, of single-point grounding, and of trying to ground power and telco entry lines to the same perimeter ground. I understand why bulkhead entry panels are effective and desirable. However:

* I cannot install a bulkhead panel or anything like that.
* I already have a UPS/power conditioner/surge protector on the power line that will have to be sufficient for lack of funds.
* I also cannot afford to stake out a perimeter ground, nor do I have much ability to bury any radials. Two or three will have to be sufficient.
* I am only concerned about protecting against an antenna strike, not power or telco lines. Those are out of my domain to mess with, anyway.
* I am more concerned about nearby strikes than a direct strike. There are at least five taller buildings with copper roofs in a half-km radius, and a range of hills is just 2km away.

In looking at my options, I figure I can do some of the following:

A Drop the coax from the antenna to the ground, and use something like PolyPhaser's Uni-Kit coax ground system to ground to one rod. Unfortunately, I think this only grounds the coax shield, and not the

center conductor, so I would need another protector. Cheap,
though.

B Use something like a PolyPhaser IS-50NX in the coax. My big
question
is where in the chain to put this? Should I put it outside my
room,
say at ground level, and bolt it to a ground rod there, and
have
another run of coax back up to my room? Or make a wooden
"bulkhead"
to fit in the bottom of my window sill and drop copper strap
down to
ground? Is it not a really bad idea to have the protector
inside the
room? Is wood a poor choice of insulator for this application?
If
so, is there anything else that I an get cheaply and is easy to
work
with?

C I can't really "ground" my handheld, but when I get the 10m
rig, I
should like to ground its chassis, if at all possible. If I
choose
the wooden bulkhead, then it is just a matter of connecting the

ground cable to the same strap going down to ground, right? If
I
choose the protector near ground option, should I just drop a
copper
braid down to the same ground rod system the lightning
protector is
on? Or maybe just connect the chassis to the AC safety ground?

I am leaning toward getting an IS-50NX or equivalent, dropping the coax
to earth, putting the IS-50NX inline at that point, connecting it to
the best ground radial system I can manage, taking another run of coax
back up to the second floor window, and not be so concerned about
grounding the 10m rig (I can't install the dipole anywhere near as high
as the vertical on the roof.)

I am _extremely_ interested in anything y'all have to contribute. I
want to provide the best ground and lightning protection I reasonably
can for <$100USD.

'73's,

==

-----
The Complete (and Mostly Accurate) Guide to Undocumented Features
of the Kenwood TH-78a Handheld Transceiver

02 Feb 94

Part 1 of 2

------------------------------------------------------------------------
-----

PURPOSE: This file contains descriptions of all the undocumented
features
of the TH-78a I could find as of this date. It doesn't attempt to
explain
anything covered in the manual, but it does pass on pointers to
interesting
uses of documented features (such as using message write 0 as a
start-up
screen).

VALIDITY: This file supercedes the following: th78a-0.mod, th78a-1.mod,
th78a-2.mod, th78a-complete.mod, th78a-new.mod, th78a-warn.mod. I've
run
this file by the authors of those mod files, where I could find them.
Be
assured that you have the best information about the TH-78a we could
put
together.

WARNING: This information is furnished without guarantee or warranty.
Working with surface-mount diodes is delicate work. Or as Eric Williams
(wd6cmu@netcom.com) so eloquently says "Lawyer bait: If you screw up
your
radio, it's your own damn fault, don't blame me. (But it worked on
mine.)"
These modifications (mods) may or may not work on your particular unit
according to Kenwood. I certainly accept no responsibility for your
handiwork or your transmitting on frequencies that you're not allowed
to.
You may have good reasons to transmit outside of ham bands as I do
during
search and rescue work (typically on CLEMARS, NLEMARS, and CALCOORD).
```

ACCURACY: Please mail me (Michael Sattler, KE6DZF) at
msattler@jungle.com
if you see any omissions or mistakes. Make sure to pass along the date
of
the version you're seeing (it's just under the title).

THANKS: Thanks be to all those who helped me, including
George_Lin@mindlink.bc.ca, Brendan_Hoar@notes.pw.com,
rfc@allegra.att.com,
wd6cmu@netcom.com, elendir@enst.fr, nyu@flute.aix.calpoly.edu

AVAILABILITY: I'll attempt to have the latest version of this file
(named
"th78a.kensho.mod") placed at the following mod servers:

Server Directory
---
ham.eetech.mcgill.ca /pub/ham-radio/mods
(aka atlas.eetech.mcgill.ca)
bubba.business.uwo.ca /mods/
garfield.catt.ncsu.edu /pub/hamradio/HAM_MODS
kilroy.jpl.nasa.gov /pub/hamradio/Mods
ftp.geo.brown.edu /pub/hamradio/rigmods
(no longer accepts anons)

And one mail server:

pcserver@novell.business.uwo.ca
examples of main body email requests are as follows:
HELP
SENDME RADIO MODS
SENDME TH215 MODS
SENDME ALLBAND MODS

SCOPE: Ever since this guide has been loosed on the net, every so often
[someone] asks:

>Would you happen to know a similar list for the Kenwood TH-77A (next one back)
>Hand Held or the TM-721A (way back) mobile radio?

I would not know about radios other than the one I own, sorry. I
compiled
this guide from old mod notes, tidbits I found on the net, and personal
experience. I'm guessing that there are others out there that have done
the
same for their radios; I suggest that you look through all the mod
servers.
(If you know of other mod servers, please let me know.)

What is a "new" TH-78a?

Kenwood says that any TH-78a with a serial number greater than 405xxx is considered a "new" TH-78a. I've not authoritatively determined the difference between the old and new models, but the mods differ, so it's worthwhile to check the serial number. The ARTSCI 5A techmod book calls this the "Later Model (with green jumpers)". I use the terms "early model" and "late model" throughout this document.

William_A._Kirsanoff@smtpgty.anatcp.rock says:

"I can tell you the difference between an "old" and "new" TH-78A. The "old" 78As had a fault in the microprocessor resulting in an inability to store a pl tone in the call channels (and possibly some other bazaarities). People who complained got the new processor installed by Kenwood when it became available (there are actually 2 microprocessors in the HT, I think the one changed is IC 5, mine has a paper label pasted over it). It seems they also added the jumpers on the programming diodes, probably to keep hams from using their soldering irons on the SMC diodes while making mods. :-)

When
my "old" unit was upgraded to the new processor, my mods from removing
the
diodes remained in place."

Basics of modifying the Kenwood TH-78a

To open the radio, follow the instructions on page 64 of the manual.
(Unscrew four screws and break apart the radio halves.) The two TX/RX
busy
indicators (LEDs) have rubber seals placed over them. These have a
tendency
to fall off when opening or closing the radio.

All position references in this document assume that you are looking at
the
CPU board with the rotary encoders and TX/RX busy indicators at the
top. If
you have installed the ME-1 EEPROM, I recommend that you temporarily
remove
it to facilitate access to the diodes.

You'll see a brass shield about one centimeter square covering the
processor chip and the surface-mount diodes on the back half of the
radio.
De-solder the shield's four corners and remove it. (I used an right
angle
surgical tweezers in conjunction with the pin-point soldering iron to
lift
the brass shield.)

Uncovered are the processor (which we ignore) and six surface-mount
diodes,
numbered sequentially from one through six (D1 - D6), top to bottom.
These
are about one millimeter wide; remember the note about skill and
finesse.
New model radios also have two large loops of green wire, numbered one
through two (W1 - W2), bottom to top.

You'll need a pinpoint-tip soldering iron and some braid to wick away
the
solder before you lift out the diode. Alternatively, Rich Garcia
(n2czf@wt3v.nj.usa) suggests leaving the diode in place. "I found if
you
BRIEFLY touch the iron to the right side lead while gently pulling up
on
the SMC diode it should completely come off without needing to apply
heat
to the other side and further risk board damage."

After you perform some or all of the mods listed below, replace the brass
shield and re-assemble the radio. Then reset the processor (as documented)
and re-enter any frequencies into memory.

Potential case design flaw

>From wb1e@k1rqg.me.usa.na (which no longer exists):

In the course of performing mods on my Kenwood TH-78a dual band handheld,
I've discovered a potential flaw in the case design. While handling my
walkie one day (after the mods were done), the display went blank and I
could not turn the radio back on. With the radio split in half again, I
could turn the radio back on but discovered all the memories were erased.
The cause turned out to be some component pins on the front face coming in
contact with the square bodies of the two volume/channel/squelch switches,
when the case is screwed back together snuggly. I placed small strips of
electrical tape on the sides of the switches to insulate, and reassembled;
problem solved. Now I have to reprogram the darn thing....

molson@bml4380.cpg.cdc.com (Mark Olson) said:

There is a warning on some of the rig mod bulletin boards about this. The
problem is that pins on the back side of the PCB that is mounted on the
front half of the TH78 can come into contact with the volume control
housings mounted on the PCB on the other half of the unit. My radio had
this problem until I put electrical tape across these housings. Symptoms
were: Display blanking momentarily and the unit power cycling, sometimes
causing memory erase, when pressure was applied to the front of the unit or
to the volume controls. I originally thought that it was a loose battery
connection...

Open up the radio and you will see what I mean... Believe me, the fix is
simple and it works.

C-17 design flaw

William_A._Kirsanoff@smtpgty.anatcp.rockwell.COM said:

"The 78A WILL lose C-17 on the control board if dropped, period. This causes loss on receive audio on the left-hand side of the radio. The solder
pads for that cap are not big enough. If you find the need to replace C-17,
use a gap-fill cyanoacrylate glue like Zap-A-Gap (tm) to increase the device footprint. I have learned the hard way. Otherwise, I have found it
to be a fine radio. My only problems have been related to the C-17 issue
and attempts to rectify it. Had I been given the above advice, it would have been a one-time only issue. As it is, I took out one of the microprocessors yesterday looking for a bad solder joint that was induced
by my attempt to solve the C-17 problem (sigh). This radio gets a lot of
use and a lot of travel. C-17 is the only thing that I have broken with the
case closed. :-)"

Mutually exclusive mods

Some of these mods are reputed to be mutually exclusive. You must choose
one of the following levels of performance:

The "beyond MARS" mod - gets you the widest tx/rx The "MARS/CAPS" mod - halfway there
The "extended receive" mod - more of a good thing

plus

The "cross-band repeat" mod - a repeater that weighs almost nothing

There is no mods that manipulate diodes D1 or D2 (I've seen it suggested
elsewhere that this is toggles the USA/Europe-ness).

Brendan_Hoar@notes.pw.com suggests:

"I think removal of D1 causes "Forced Channelized Mode", at least on the
"new" radios. If you put both VHF and UHF memories into a TH78A without D1
and
power on, you are stuck in channel mode until you do a full memory reset.
Remember, you can't add frequencies or do any tuning in channel mode.

If you think about it, you'll want to be very careful not to let D1's
circut become an open circut."

The "beyond MARS" mod:

This mod provides the widest possible range of tx/rx. The mother of all
TH-78a mods.

To mod (early model): remove diode D5 only.

To mod (late model): remove diode D3 and cut wire W1. D5 has priority
over
D3, so if you've already made the mods for the old model (which
included
the removal of D5) you must resolder D3 into D5.

Yields RX 50-179.995, TX 136-179.995, RX 300-399.995, RX 400-511.995,
TX
400-511.995, RX 800-999.995.

To use: buttons operate the same way as described in the "extended
receive"
mod, except that you can transmit on a much wider range.

NOTE TO ALL: I haven't been able to verify the actual operation of my
radio
on all these freqs. Kenwood talks about the difference between the
"dialable" range and the operating range. I'd like to come up with a
chart
for each level of mod that combines the above and the two following
offerings. Help me, please.

* *

Left VFO Right VFO
50.000-85.2x (with beep) 50.000-110.xxx (with beep)
85.2x-179.995 110.xxx-179.995
300.00-399.975
400.000-511.9875 400.000-511.9875
800.00-999.9875

* *

Receive Transmit
--- ---
50-135.995 (AM) VHF (NA)
136-179.995 " 136-179.995
300-399 (AM & FM) " (NA)
400-511.99 SUB-UHF 400-511.99

400-511.99 UHF 400-511.99
900-949.9875 " (NA)
50-179.995 (FM) SUB-VHF 136-179.995

The "CAP/MARS" mod:

This doesn't cover as much room as the beyond MARS mod does, but may be more appropriate for those who use the CAP or MARS frequencies.

To mod (both early and late models): remove D6 only.

Yields RX 118-173.995, TX 142-151.995, RX 400-511.995, TX 425-454.995.

The "extended receive" mod:

This is the mod that's usually given to hams to pacify them (the beyond MARS mod is closely guarded).

To mod (both early and late models): remove diode D5.

To use: press 'F' for one second and then pressing the Band button will switch the UHF VFO to a 800-999.995 MHz band and the VHF VFO to a 300-399.995 MHz band. The regular VHF VFO can now receive down to 50 Mhz.

The "cross-band repeat" mod:

Allows you to... (WHAT!?!)

To mod: remove diode D4.

To use: press 'F' for one second, then '0'. Repeat to disable. The MHz dot
will flash when in repeater mode.

Toggle SHIFT button function

Press SHIFT during power-up This is described in the manual, but the documentation is not complete. The TH-78A can operate in two modes: In SPLIT mode, non-standard offsets (i.e. split frequencies) are supported,
but the default offset is not programmable. In SHIFT mode, non-standard offsets are not allowed, but the default offset is programmable. To select
the default offset, press F for 1 second, then SHIFT. See p. 30 of the manual for details on changing the default offset.

Toggle CALL button function

Press CALL during power-up. The CALL button can operate in one of two modes. In the default mode (CALLSW), it switches between the call channel
and the last memory channel (if in memory recall mode) or last frequency

(if in VFO mode). After toggling the CALL button functionality (VMC), it
will switch from the VFO to the last memory channel and then back to the
CALL channel.

Observations on post-mod performance

Rich Garcia (n2czf@wt3v.nj.usa) observes "all original functions have
maintained the same which is great. Aircraft band which was accessible
before the mod remains with the same characteristics. It seems that
VHF-High band has improved a bit on sensivity where it was dead as a dog
before the mod (above 155.000MHz) but the 162.000 MHz band where weather
radio is is still a bit deaf for reception at any distance but about 20
Miles. This depends on your (or my) terrain and transmitter output
power.

"On UHF all public safety frequencies up to about 500 MHz seem to come in
well but sensivity greatly drops from there (we really can't ask for
more).
Frequencies can be programed in up to the 920MHz ham band but I have no way
of measuring sensivity. 800MHz works but the signals are very weak, you
must be near the transmitter for reception. Assuming you are in the town or
city where the transmissions originate it should work.

"Transmit is enabled up to and incl. 500MHz but after testing this on a
frequency counter I find that a signal is only generated to about 490 MHz,
even though the trans. LED shows output in the higher frequencies.

"Crossband repeat seems to work fine but the audio is unacceptable for use,
BE AWARE the radio gets HOT! Prolonged use or use on a busy frequency would
not be recommended. Also remember this is a dual band HT please use a
proper antenna while in this mode to avoid a high SWR, we should all know
better... Right?"

Someone else said:

"I found that marine weather reports at 162.40MHz in my area were received
much better on the SUB-VHF band, than on the VHF band...

"If you are having problems with intermod, try switching bands (i.e.
using
the SUB-VHF band rather than the VHF band.)"

blood@vnet.IBM.COM says:

"I did the beyond Mars mod for the newer model. All worked as
described.
One note however, I seem to have lost the automatic repeater shift
function."

elendir@enst.fr (Elendir) speaketh from across the "pond":

"Hello, I have a TH 78E (European version) and I have made the "beyond
MARS" mod. I found this afterwards :

The key combination POWER + CALL acts as a toggle on the CALL key.
Either
the CALL key has it nominal function or the CALL key acts as a V/M/C
scan
initiator. (In the manual, it is said to be possible for US version
only).
Does the US version acts similary or is it a specific behavior?"

shortly thereafter he sent a follow-up:

"Ok, it was a little mistake. It doesn't act as a V/M/C automatic scan,
but
a V/M/C switch. I mean if you are using the VCO, CALL switches you to
the
CALL channel, then to the most recently used memory channel, then back
to
VFO.

Also, the combination POWER + DUAL displays something like "SAMPLE".
Anybody knows what it is about?"

The Complete (and Mostly Accurate) Guide to Undocumented Features
of the Kenwood TH-78a Handheld Transceiver

02 Feb 94

Part 2 of 2

------------------------------------------------------------------------
-----

------------------------------------------------------------------------
-----
Cloning

The TH-78a's memory can be copied from one TH-78a to another TH-78a
entirely through radio waves "over the air" (i.e. without cables or
other
special equipment). Theoretically, this could be done via repeaters,
although I've never heard it done. Allegedly this requires a mod that
includes removal of D5 or D6, but I haven't researched it.

Cloning is a real boon to groups that want a bunch of radios to contain
the
same memories, such as amateur radio clubs, search and rescue units,
and
people too lazy to program their radios. Of course, given that the ME-1
memory expansion unit has 250 memories, laziness is understandable :-)

(1) Set both radios to the same frequency.

(2) Activate both radios by pressing the '0' key while turning the
power
on. The radios will display the word "clone".

(3) Now, click the PTT button of the "master" radio. The radio will
transmit in the economy low power mode. This may take about 4 minutes
for
fifty channels, or 20 minutes for the 250-memory ME-1. When the data
has
been transferred, both radios will revert back to their original
frequency.
(It is recommended that a dummy load be used to prevent unwanted
interference.)
```

(4) Turn both radios off and then on again. The slave is now a mirror-image
of the master radio.

Cellular Telephones

Cellular phones operate at (tx) 824.040 - 848.970 (rx) 869.040 - 893.970,
within reach of your modified TH-78a. The increments are, however, every
30kHz; the TH-78a will only increment in 25kHz steps at this frequency
range, so the exact cellular frequency cannot be tuned in (most of the
time).

Battery life on the TH-78A

wd6cmu@netcom.com (Eric Williams) says:

Some people have complained about the battery life on the TH-78A. I came up
with these tips by checking out the power consumption under various
configurations. In the case of power-saver mode, figuring out the average
current with my DVM was impossible, so I ran the radio on a large capacitor
and timed how long it took to die. These tips won't solve everything, but
they might help.

The rig draws close to 2ma even with the power turned off, so don't leave
the rig off with the battery installed for several days and expect full
capacity to be maintained.

If you're only using one of the bands, shut down the other to extend your
battery's life -- current consumption with the squelch closed is cut by
almost a third.

If you're monitoring two frequencies on the same band, use the f2 button to
receive both simultaneously rather than scanning between them -- the
battery saver with two receivers will use about half the current of one
receiver that is scanning.

You can make up a battery pack by putting nickel metal hydride AA cells in
a BT-8 battery holder. A small strip of aluminum from the positive battery
terminal to the depression in the top of the case will allow you to

recharge the pack inside the rig. This will give you 1000mah capacity
without enlarging the size of the radio, and NiMH cells have no memory
effect. (But they *are* expensive.)

The TH-78A (USA) vs. the TH-78E (European/Japanese)

CTCSS:

Eric Williams (wd6cmu@netcom.com) reminds us that:

>The manual says that the CTCSS module is an option on the European model, but
>standard on the U.S. one.

Vince (elendir@enst.fr) replies:

>That's ... because [the French] repeaters are activated by a 1750-hertz tone.
>If I intend to go to US this summer, must I buy the CTCSS module ?

biocca@csg.lbl.gov (Alan K Biocca, WB6ZQZ) says (and I paraphrase):

>While it varies geographically, where I am (Lawrence Berkeley Laboratory,
>California) very few 2-meter repeaters require CTCSS tones, most 440 MHz
>repeaters do. Many of those that do are closed anyway. You can probably get by
>without them.

gsm@mendelson.com (Geoffrey S. Mendelson, N3OWJ) tells us:

>It depends on where you are. In the Philadelphia area most of the open 440 MHz
>repeaters use CTCSS and none of the 2-meter ones do. At least one uses CTCSS
>for remote inputs.

>About 60 miles away in southern New Jersey, all of the 2m and 440 repeaters
>use CTCSS.

Frequency range differences:

Someone (I've forgotten who) suggested:

>Um, I'm pretty sure that the unmodified UHF TX range is different.

Kenneth E. Harker (kharker@bnr.ca) wrote:

>These are the VHF - UHF bands authorized in France :

>I would guess that the TH-78E only does 144-146 and 430-440 while the TH-78A
>does 144-148 and 440-450.

torsten@rnivh.rni.sub.org (Torsten Leibold) summarized for us:

>Yep, you're right. The A version is the American version and the E stands for
>Europe. The E version does 144-146 MHz and 430-440 MHz without modifications.
>(I guess there are some secret codes to switch it to the "A"-bands, but I
>don't know them).

I don't know of any "secret codes", but I'd heard that D1 toggled
between
'A' and 'E' performance. Unverified. -- msattler

Customizing the start-up message

William_A._Kirsanoff@smtpgty.anatcp.rockwell.com says:

Just in case you are doing a message write, don't pick slot '0', that
would
change your start-up message (default is "TH-78A", mine is "KD6MCI" :-)
)
You can then crack open the manual and read up on how these features
work.
I use the autodialer regularly. I don't have much use for the message
memory other than the start-up trick though.

TH-78a loses the call channel CTCSS tone

George_Lin@mindlink.bc.ca says:
>Michael Sattler writes (regarding George's comments):

>Can you come up with an easy procedure for the readers of the guide to check
>whether their particular TH-78a loses the call channel tone? (I want to hear
>what you do, rather than make something up.)

Sure.

Go to the oscillator on the right (UHF oscillator). Select a UHF
frequency
on the VFO. Set the CTCSS tone frequency to some arbitrary number, say,
94.8 Hz. Turn on the CTCSS. Save the whole thing under the call channel
for
UHF. Select another UHF frequency. Select another CTCSS tone. Turn the
subaudible tone on and save it under a spare memory channel. Go back to
the

call channel and check the tone frequency.

Greg Hammond's Receiver Tests

gregh@swifty.dap.CSIRO.AU (Greg Hammond) in a rare moment says:

"Some time ago I did a quick comparison of TX power output between the
TH78A, the Alinco DJ580 and the Standard C558. The Kenwood had BY FAR
the
highest power output at 477MHz."

Greg's done both RX and TX power measurements of the TH-78A; the RX
numbers
follow and the TX numbers are forthcoming. As I can't make head nor
tails
of these numbers (remember, I have to wait for the soldering iron to
get
hot to figure out which end's which :-) I'd appreciate your comments on
Greg's work.

Test conditions.

Powered from 7.2 volt battery pack.
Single band mode used.
All figures are for NFM mode unless stated otherwise.

Method.

FM mode: The audio output from the earphone jack was measured
with an AC millivolt-meter. A calibrated RF generator was connected to
the
antenna BNC. The RF generator output level was increased until a 12db
fall
in audio (noise) was measured. The generator level was recorded in
the
'Sensitivity' columns below. There was no modulation on the RF signal.

AM mode: Same as above except the generator level was adjusted so
that changing the AM modulation from 0% to 90% caused a 12db increase
in
audio output. The modulation frequency was 400Hz.

Sensitivity was measured at the displayed frequency and the 1st. IF
image
frequency. Note that sometimes the TH78A is more sensitive at its image
frequency. (395MHz to 430MHz is best received by tuning from 305MHz to
340MHz)

Image freq. = Displayed freq. +or- (1st. IF freq. * 2)

Stuff that didn't fit anywhere else

Early on, msattler@netcom.com (Michael Sattler, KE6DZF) mentioned:

>I've had one report that the TH-78A is capable of in-band full duplex
>operation. I've been unable to repeat this on my unit, which only has the
>CAP/MARS mod perform. Confirmation of this feature would be appreciated.

nyu@flute.aix.calpoly.edu (Neal, KD6HPG) replied:

>My friend (N6RNF) has a "early" model radio and it was capable of doing
>in-band full duplex. I have a "later" model of the TH-78A and I can't get it
>to work on mine. My friend's radio has the beyond MARS mod.

Game Mode

ORIGIN: aviator@athena.mit.edu (who no longer exists), who credits
james@brokaw.lcs.mit.edu for "much of this".

To enter the game mode press M and PTT during power-up. Be careful not
to
accidentally reset the memory, which happens with M + power-up. (Don't
freak; you'll see the same "all screen items lit" when entering game
mode
as when you reset memory.) To exit the game mode at any time, press the
LAMP key. The volume, lamp, or frequency settings can't be changed
while in
game mode.

The top part of the display will show "H.00", which represents the high
score. The lower part shows a scrolling message, "PRESS ANY KEY".
Pushing
any key starts a "Follow Simon" type game. The display will briefly
show
one of the characters '1', '2', '3', or 'F'. Press the corresponding
key.
The game consists of repeating the displayed character sequence, which
increases by one character each round.

After you "win" the Simon memory game by getting correctly entering a
sequence of twenty characters, the next game is a draw poker game.

The way it works is that you choose your bet (from 1 to 10) by pressing '2'
to increment the bet and '5' to decrement the bet. Then, press 'F' to deal
the five cards. The face value of the cards is displayed, and the suits can
be seen at any time by holding down the PTT key. Any number of cards may be
discarded, and to select (or deselect) a card for discarding, press the
keys '1', '2', '3', '4', or '5'. If a card is selected for discard, it is
displayed "face-down".

Press 'F' again to draw new cards. Your new cards will be displayed, and
then if your hand is 2-pair or better, the screen will show the rank of
your hand on the left (2P for 2-pair, 4K for four-of-a-kind, etc.). On the
right the pay-off for that hand will be displayed. Your bet is multiplied
by the pay-off factor,and the resulting pile of cash is displayed in the
right hand side of the upper screen. (The left-hand side of the upper
screen contains your table stakes, which are initially 100 coins from
winning the Simon game.)

If you win the poker hand, pressing any key steps into the next stage. If
you lose the poker hand, your bet is deducted from your stakes and you are
asked to start another poker hand. In the next stage, you are asked
"TRYB/S" which means, "Do you want to try double-or-nothing in a guessing
game for Big or Small cards?" Press 'F' for yes, press TONE for no. If you
say no, your winnings are credited into your stakes and you are asked to
start another poker hand. If you say yes, then a single
shuffling/incrementing card is displayed on the left, and three stars are
displayed on the right. You have to choose to go for either BIG or SMALL,
by pressing '2' or '5'. You can keep pressing '2' and '5' to change your
mind. When you are ready, you must try to hit the 'F' key to stop the
rotating card display, and the card will show, and you will either win,
lose, or draw. If you draw, you have to play big/small again, I think. If
you lose, your winnings are gone and you can play poker again. If you win,
your winnings double and you are asked whether you want to play
big/small

again.

The payoffs on the poker are set against you, odds-wise; the
double-or-nothing game includes a draw, so the odds are against the
player
there unless you can time hitting the 'F' key to win more than half the
rounds. I haven't managed to do this, so I don't know if there is
anything
beyond this, all I know is that when the table stakes are exhausted,
you go
back to playing Simon again.

This is the end of The Complete (and Mostly Accurate) Guide to
Undocumented Features of the Kenwood TH-78a Handheld Transceiver.

4506. Viking Ranger Xmtr

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-26 00:49:00 UTC
From: lin.robertson@digcir.cts.com
Message-ID: <940925220045109@digcir.cts.com>
Source record: 223951

I have long been a collector, restorer and lover of vintage receivers, both ham AND broadcast, but recently got bit by the transmitter bug in the form of a Viking Ranger. After overhaul, this little gem lit up and performed just fine using a dummy load.

BUT, being new to tube xmtr theory, there are some things I find rather puzzling...perhaps someone with one of these little jewels could help me understand some things:

1. How in the heck are you supposed to get a CW sidetone from these things? It would be nice if you could hear your keying.

2. Is it possible to use my Vibroplex Brass Racer keyer/paddle combo without torching the Curtis chip inside?

3. There are TWO 1/4 jacks in the back...one is for the key, obviously, but the other is ??? Upon putting a 1/4" plug into it, the main relay in the xmtr deactivates when the function switch is on "phone"...is this some sort of PTT switch?

4. Loading a tube final is quite a new experience! Are you supposed to tune the coupling for maximum plate current, then dip the final, THEN re-tweak the coupling again, then re-dipping the final until you get "maximum smoke" from the the in-line wattmeter I'm using? There's a trick to this, I know...what is it?

Thanks in advance for your help with my first fumbles toward a vintage AM/CW station.

4507. Suggestions needed for 2M handheld

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-26 01:47:40 UTC
From: dnedved@hubcap.clemson.edu
Message-ID: <36597s$1um@hubcap.clemson.edu>
Source record: 224027

Hello world,

I need some suggestions about what would be a really good 2M handheld.
I like the Kenwood TH-79A, The Yaesu FT-11R, and the Alinco DJ-F1T or
DJ-G1. I've been listening for awuhile, but just got my license in the
mail yesterday, and am itching to transmit!

My primary concerns are working a rather distant repeater, so good transmission
would be a primary concern. Second is cost, although I want a very sturdy
radio that I won't outgrow in the near future. 70 cm is of no importance to
me. Also, I don't know if it's possible, but a handheld which could be used
for packet would be ideal. Small size and "bells & features" are also of
limited importance. I guess you could say that everything is important :).

Any suggestions, endorsements, warnings, suggestions of dealers, etc. would
be more than welcome through e-mail. Also, anyone selling any used handhelds
let me know too!

Thanks in advance,

I have an Icom W2A HT that seems to discharge batteries when turned off. It draws about 18ma from any attached power source. It will drain the BP-84 in a day or two if left attached. Has anyone else has this problem? Is there an internal backup battery that's shorted? It seemed to start doing this after I left it unused for about 6 months. Any insight appreciated!

From: little@iamu.chi.dec.com
Message-ID: <365pc8$bpf@nntpd.lkg.dec.com>
Source record: 224033

I recently purchased some HP coaxial relays from someone here on the net
and had a question that I was hoping someone else here could answer. The
relays are rated at 1W average and 100W peak. How do I judge the
maximum amount of time I could key down with say a 10-20W transmitter
before running into a problem? My intended usage is T/R switching for
some UHF/SHF transverters I'm building and I have modules capable of producing
5, 10, and 20 watts. Am I crazy to try and use these relays for this
application?

I have a IC 22A that is working that I do not use. It has a number of crystals installed in the radio. It does not have a speaker and the mic has been replaced with a different brand. I have been told it has very good audio. You would need to supply 12 volts as I do not have a power supply for it.

I would imagine it is not cost effective to send this radio overseas but I thought I would let you know that I have one if you want to go to this expense of importing it.

Hi Rick, Sure, post the answers to questions here. The problem is that the exact same answer--which is VERY long--is posted here every few days, and for those who are charged by the hour to access these boards, it gets frustrating to see the same word-for-word notes uploaded again and again.

Yes you can install a bulkhead panel, but you'll have to make it.
Just make a metal panel (instead of wood) that will fit in the window
with the window closing down on it. A rack panel, or a chassis box can
be used, in a wooden frame if necessary to fit the window. Bring your
coax through that panel with a NEMP series suppressor, and run your
ground strap from the panel down to your ground rod (bury as much copper
as you can along the side of the house containing the rod. It doesn't
have to be real deep.)

Use that metal panel in your window as your station single point
ground. Tie your power third wire to the panel too, and use a
power line suppressor at the panel if you can afford it. (I strongly
recomend this.)

This isn't perfect, but it's about the best you can do short of
doing it right. If you keep everything reasonably straight and
well bonded, it should give good protection.

Gary

>Is that how it is supposed to work?

No, of course not. However, for a Frequently Asked Question, and
the HTX-202 questions qualify, Emailing the appropriate part of
the FAQ is the proper response. Otherwise we see the same answer
day after day on the group, and that wastes bandwidth. Posting
the reply every few weeks is OK to catch up the newbies, but it
shouldn't be done *every* time someone asks.

4519. HT RX Specifications!

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-26 13:32:28 UTC
From: Tony.Komljanec@banyan.dgim.doc.CA
Message-ID: <M1g8+1LhVia@banyan.dgim.doc.ca>
Source record: 223950

There has been a lot of recent discussion about the Radio Shack HTX202 vs other HT's. I've seen a few interesting comparisons, but one thing is very obvious. Hams are very ARTISTIC people.

One person's opinion goes deep and heavy into the HTX202's apparently good intermodulation handling abilities. The next day, another person ignores this quality and concentrates on bells and whistles. The third day, yet another ham laments that a radio doesn't have dual receive in the same band, a demand that technically negates the receiver's intermodulation rejection.

No one ever mentions SPECIFICATIONS (a form of comparison among technical people), and the manufacturers certainly don't provide anything other than the sensitivity achievable in their ideal laboratory conditions. Some hams then proudly proclaim this spec for their particularly wonderful HT, while a nearby paging transmitter 15 MHz (!!!) above the ham band is firing through their wide band front end and sending the mixer into the twilight zone (please excuse this bit of artistic flair). The end result is an HT with the "real world" sensitivity closer to a brick or spewing forth endless POCSAG and two-tone paging, even with only a rubber duck antenna.

My point is that we should be comparing apples to apples, admittedly difficult even with technical specifications. In the past, I have performed comparisons of expensive amateur receivers using measured TWO-TONE THIRD ORDER INTERMODULATION DISTORTION, intercept points, dynamic range, 1 dB compression point, etc. For instance, good spectrum analyzers have TOI's in the +10 dBm area. A lab grade measurement receiver would have a TOI as high as +18 dBm or more. This translates as: "attach it to an outside antenna and don't worry too much about intermod". Most amateur grade base station receivers tested (and costing a FEW thousand dollars) had TOI's down around -10 dBm (yep, that's a minus sign), and some even worse. That equates to: "don't even think about it without an attenuator or bandpass filter".

Very few times have I even seen our amateur magazines publish real technical reviews about VHF/UHF transceivers. The reviews provide artistic evaluations useful only in comparing features, not performance. Is there something that is being hidden? Why don't these magazines square off these radios against each other similar to what is done in the stereo and computer markets?

After all this introduction, my points:

1> One can't expect $20,000 performance from a $3000 amateur receiver much less a $200 HT, but it would be nice if we could compare the different models available! A person living in the country can then consider more bells and whistles at the cost of the TOI. A big city slicker can give more weight to IM performance.

2> Please use technical specifications where possible! The english language is very poor at this job. When you buy a new HT, the salesperson tells you HOW MUCH it costs, not simply "a lot of money". Always QUANTIFY!!!

3> I would really enjoy a technical forum in a ham-equipment listserver. Is there one around???

|>
|>Or even better if you have had the chance to compare it against the
|>PK232.

I can't compare it to the PK-232, but I've had a couple of the 1278 data controllers. It basically seems to do what it's designed to do. My biggest complaint is that it is a prodigious producer of RFI. I have 4 computers in my shack plus a boatload of communications gear such as communication servers, modems, etc., and the only thing that comes close to producing as much RFI are a couple of my monitors that happen to have sweep rates that have a couple of amateur frequencies as harmonics. I can hear the MFJ on 17 meters and it's loud on 15 meters.

I'm also not certain about it's RTTY performance and I've never tried the SSTV or WEFAX capabilities as I didn't buy their software package.

Does the PK-232 allow operation on both ports simultaneously? The MFJ does not.

: scanner. I now have a coax switch in line with the scanner, but it is a
: pain to shut off the scanner, push the switch, take down the radio antenna
: before I can TX. Has anyone had experience with this problem. I would
: love to have a switch that senses the RF and switches the scanner out of
: line. Does anyone know of a duplexer that would work? Any help would be
: greatly appreciated.

Youch!!! You're lucky that's all you blew out!!! My suggestion would be
to make a PIN diode attenuator like those used in in-line preamps. An RF
sensing circuit (either in the 2m radio's coax or the scanner's, if the
circuit is sensitive enough) will clamp the RF heading for the scanner.
Check the ARRL handbook - failing that, check some of the VHF stuff in
QEX, etc... Good luck!

> 1. How in the heck are you supposed to get a CW sidetone from
> these things? It would be nice if you could hear your keying.

In the "good old days" this was a common problem (I had it with
both a Viking Adventurer and Viking II). The most common solution was
to listen to yourself through the receiver; early on, I used a separate
receive antenna with my Hallicrafters S-38D, but with the Viking II and
a BC-348-H receiver I used a coaxial relay which provided about 60 dB
of isolation when in "transmit" and still listened through the receiver.

Later, I built a small transistor oscillator and powered it off
of a resistor in the ground side of the key jack (the transmitter was
cathode-keyed) to provide a keying tone.

The Ranger is grid-blocked keyed, so one possibility is to look
for a current path that only passes current when the key is down and
doesn't rise to some destructive voltage when the key is up (like a
cathode keyed circuit is, which is why I used the *ground* side of
the key jack to obtain my DC voltage; with the key up, the hot lead
rises and you can get a nice "bite" across the key contacts with
this technology). Insert a small resistor and use the resultant DC
voltage to power an oscillator. Or, use an NE-2 neon lamp near the
tank circuit as a RF-controlled switch to turn a sidetone oscillator
on and off. Or......take a look at some of the old Handbooks from
the early to mid-1960s. Lots of ideas there which are adaptable
using today's transistors.

> 2. Is it possible to use my Vibroplex Brass Racer keyer/paddle
> combo without torching the Curtis chip inside?

I'll have to pass on this one.....I still use a bug.....

> 3. There are TWO 1/4 jacks in the back...one is for the key,
> obviously, but the other is ??? Upon putting a 1/4" plug into
> it, the main relay in the xmtr deactivates when the function
> switch is on "phone"...is this some sort of PTT switch?

That's probably exactly what it is. I'll bet your mike jack is
an Amphenol mike connector which the plug screws onto and only connects
the audio; ergo, you need a separate cord and 1/4" plug for the PTT.

Remember that in the old AM days, we simply operated by flipping
the "plate" toggle switch on the front rather than using PTT. Some
transmitters also provided a 115 VAC set of contacts for an antenna
relay which were only activated when the plate switch was "on."

VOX wasn't popular until SSB came of age.....

> 4. Loading a tube final is quite a new experience! Are you
> supposed to tune the coupling for maximum plate current, then
> dip the final, THEN re-tweak the coupling again, then re-dipping
> the final until you get "maximum smoke" from the the in-line
> wattmeter I'm using? There's a trick to this, I know...what is
> it?

You've got it right, but dip the final FIRST, *then* increase the
coupling to raise the plate current, then re-dip, then coupling, then
dip, etc. There is a maximum plate current which you should *not*
exceed in the fully-loaded configuration, and given what 6146s cost
these days I'd make that an iron-clad rule! In the old days, especially
with 807s (which were cheap), I used to "goose" a little more power
out of it (let the plates run just a little cherry). BTW, check the
book on the maximum permissble current. Use the wattmeter just as a check
on efficiency (should be around 65-70%). I think the maximum input
power on a Ranger is 90 watts, so you should see 55-60 watts out, maybe
a bit more.

>Thanks in advance for your help with my first fumbles toward a vintage

Matthew Davies (ab910@lafn.org) wrote:

: Is the HR2510 still made? Is it the same as when it first appeared or did
: they ever change it to be 10 meters only? I remember a rumor that Uniden
: was going to change the unit due to FCC pressure. Neat little radio. Like
: to buy another, if they are still made.
: Thank you.

The HR2510 was replaced by the HR2600 for the exact reason you speculated about, to eliminate the 11 meter conversions. Just before the 2510 was killed off, Uniden had tried potting the microprocessor in epoxy. This didn't seem to be enough to satisfy the FCC though and the 2600 followed soon after with a new microprocessor hard coded that would not do 11 meters.

I have an "Early" 2510 and have been patiently (OK not so patiently ;-) waiting for the Sun-spot cycle to turn around. If anyone has the 11 meter mod for the 2510, I would appreciate seeing it. Being able to listen in on 11meter Ch.9 might be interesting in addition to the scanner for Police and Fire stuff in the truck. Before anyone quips about transmitting on 11 meters with a mod'ed radio, all I can say is WHY would I want to?

Also, I have heard about a really simple 65 watt power mod. Something about just changing one final transistor or something. Never been able to find this mod either.

Won't you have problems with ground loops when you hook the house 3rd wire to a second ground? It's already grounded once at the service entrance, which in my case is clear on the other side of the house.

Also, by "power line suppressor at the panel" do you mean the service panel, or your tin box in the window. If it's the tin box, how do you hook it up?

Thanks,

Greg KD6KGW

I've heard comments before to the effect that your ground rods should be deep. How important is that?

Also, is there any reason not to use 3/4" type L (the medium weight stuff) copper pipe? I've found that in general I can drive a 10' section into the ground and it costs less than a 1/2" or 5/8" plated ground rod. I would think it would out last and out perform a plated ground rod any day (although driving it in rocky soil might be a problem.)

On a slightly related issue, what is adequate for ground connections. I've seen everything from #10 aluminum wire to 1" or greater tinned braid suggested. Is #8 or #6 copper adequate? Or is the braid from old RG-8 sufficient?

|>Use that metal panel in your window as your station single point
|>ground. Tie your power third wire to the panel too, and use a
|>power line suppressor at the panel if you can afford it. (I strongly
|>recomend this.)

What's a "power line suppressor"?

|>This isn't perfect, but it's about the best you can do short of
|>doing it right. If you keep everything reasonably straight and
|>well bonded, it should give good protection.

How does one bond something? I can find no reference to bonding in any of my handbooks.

Just looking to improve my grounding and lightning protection.

>of isolation when in "transmit" and still listened through the receiver.

The coaxial relay was for antenna switching and provided 60 dB
of isolation to the receiver input (I should have made that more clear).

> The Ranger is grid-blocked keyed, so one possibility is to look
>for a current path that only passes current when the key is down and

>rises and you can get a nice "bite" across the key contacts with
>this technology). Insert a small resistor and use the resultant DC
>voltage to power an oscillator. Or, use an NE-2 neon lamp near the

Again, I may be confusing you here; with cathode keying (which the
Ranger does NOT have) you are keying the cathode of an oscillator or
amplifier (or both) on and off, and in the "key up" condition there can
be a LARGE voltage present. So, to develop a small voltage across a
resistor in "key down" with *no* voltage present in "key up," it is
necessary to isolate the key jack from ground and then connect a small
value resistor (the value depending on the normal "key down" current)
to ground to develop DC bias for the sidetone oscillator.

With the Ranger, look at the way the circuit operates with the
blocked-grid keying scheme and try to find some place convenient to
to insert a small resistor and develop bias for a sidetone oscillator;
or check out an old Handbook for alternative approaches.

>on efficiency (should be around 65-70%). I think the maximum input

Actually, try 75-80%; that's closer to the mark for Class C.

4539. ETO 50MHz NMR amplifier info sought..

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-26 21:28:06 UTC
From: michael@vk2bea.UUCP
Message-ID: <1206@vk2bea.UUCP>
Source record: 223965
Cross-posted to: sci.electronics,rec.radio.amateur.equipment,rec.radio.amateur.misc

I have a 50 MHz "driver" amplifier for an NMR device. It was made by
ETO (the same people who make the Alpha amateur amplifier). Unfortunately
ETO won't tell me anything about the amp because they manufactured it
for another company. They wouldn't even tell me the name of the company!!

I have the circuit diagram but what I want to find out is at what power
level it was used at. I would also like to find out what the transformer/
power supply is good for. The valve (tube) is a 3CX800 equivalent but
some of the componentry looks whimpier than 800 watts. (the output connector
is a BNC!). If the power supply can cope with it, I could upgrade the
other components to make a very nice 50MHz 800 watt amp.

The p/n is AD101D Driver Amp. If anyone recognises this device I'd appreciate
any information.

I could not tell if you connected each channel to your scope,
i.e., left channel to vertical, right channel to horizontal.
This would give you a cool display of the phase difference
between the two channels. I have done a similar thing with
a couple strings, a ball of cotton, a small mirror (like from
a mirror ball), a junk speaker, and a helium neon laser (a real
bright flashlight would work). Tape the two strings crosswise
across the speaker. Glue mirror to where strings cross.
Put cotton ball between mirror and speaker cone. Reflect
laser (or bright flashlight) off mirror. Crank it up.
Whackiness ensues.

I would like some suggestions for receivers in repeaters? We have a 440 machine on 444.6 but the hill top its on has high rf in the 450+MHz regions. We are using hamtronics for the receiver now but that isn't quite cutting it. One other problem is a radar operating in the middle of the band that kicks up problems now and then also but we can live with that if the receiver was working half way decent. Is anyone using Spectrum Communications equipment in high rf areas?

Thanks Russ WL7AG 'russ@news.primenet.com'

OK, this thread may be dead (or barely beating) but I'll still post something anyway...

But in the old days (ca. 76-79) I installed more than my fair share of antennas for commercial two-way radios and I dare say, CBs (remember those?). We were a Generous Electric rep. (apparently GE was generous whereas Motrash, err Motorola, wasn't - or at least not as). But I'm boring you, so back to those holes in the roof...

The best way I found was to remove the headliner and get to the middle of the roof if at all possible (sometimes it was possible to remove just the dome light and snake the coax down the door partition or the metal channel on either side of the windshield). Back in the 70s it was fairly easy - I remember some vehicles were coming out where it was somewhat tricky to mount there because of a low-profile structural channel brace. I'd drill an access hole through the brace if necessary (headliner removed, of course!) and use the Antenna Specialists (OK, they may not have invented it) 3/8" antenna mount. Of course, one may be constrained by the antenna loads available with such a mount in the ham bands (I'm not a ham but that may change). It's easier to plug up a 3/8" hole when it comes to resale of your vehicle, also. On pickups, it was fairly straightforward to do the dome-light bit (usually requested by those who wanted rigs installed) and I remember one old pickup (Dodge?) that had a double metal roof in which it *had* to be done this way.

I really liked that 3/8" mount from A/S. They even souped it up with a more weather-proof design; I still see it when looking at antennas here or there. Larson used a 3/4" mount that was OK and their loads were lower in profile than A/S's.

But how did I cut that damn hole for the Larson-type mount? Usually didn't since most customers didn't want a damn 3/4" hole in their roof! But it was with a cone cutter when they would let us. A cone-cutter without those fancy steps you can get these days - just a good, high quality, will-cut-through-metal-like-butter cone cutter! No 'wizzy-bang hole saw', no drill bit - A CONE CUTTER! Well worth repeating, they are really, really, nice to use - hell, we used one a 'zillion' times and it still worked wonderfully (got lotsa abuse too <not from me!>). Don't have any brand names for you, but expect to pay nearly $30 for a good one. And you'll find more uses for a cone cutter than some specialized 3/4" hole drillin' do-dad for antennas.

Kelly

4552. Motorola Radius Questions

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-27 12:13:45 UTC
From: George Rybicki <seryb@lims01.lerc.nasa.gov>
Message-ID: <36929p$nn5@sulawesi.lerc.nasa.gov>
Source record: 223972

I have a few questions for someone familiar with Motorola Radius HT's.

I found a Radius P10 at a hamfest recently. To my surprise and delight it was set up for 6M.
The unit was set up for one channel 52.525 simplex. I was not aware that Radius was available in VHF Low band.

The questions.

1. The unit has a 2 position channel switch, can it be set up for 2 channel operation?

2. How do you set it up? Does it require a second channel element/ xtal or just
reprogramming?

3. The antenna is a thick, rather long rubber duck with a yellow dot on the base. Is this the
correct antennna for vhf low?

4. Where can I get another low band Radius?

Thanks

George (KE8YX)

I bought an Alinco DJ-F1T as my first, and still only HT. I absolutely
love it. This has 40 memories, plenty for me. Extended transmit and/or
extended receive is an easy mod, I can send you instructions. It is
RUGGED. It is small. I can stick it in a belt pack and go on a walk
and pull it out when I get to the top of a hill. Despite its small size,
it has very good audio quality, making it listenable in a car. It is
a bit frumpier in aesthetic design than the sexy Kenwoods.

The DJ-F1T and the DJ-F1TH are identical, except the latter comes with the
high power battery. Like most HTs, power output depends on power input.
At 7.2 volts (standard battery) output is 2 watts. At 12 volts output is 5
watts. I live on a great VHF hill, and I can work repeaters in a 30mi radius
with no trouble.

Send me direct e-mail if you want more info on this, my favorite toy!

Yes the power will vary a lot from 12 to 13.8 volts. Your vehicle battery
should be reading somewhere around 13 volts anyway when fully charged.As
always Gary is correct in his assesment and possible solutions.

>my case is clear on the other side of the house.

You'll have trouble with ground loops if you *don't* tie the power
ground lead to your single point ground connection. Besides the NEC
requires you to tie the service ground to the antenna ground. What
you are trying to achieve is equal potential on all the "ground" cables
entering your equipment. What you *can't* permit is to have your equipment
be part of the path to ground for lightning energy.

>Also, by "power line suppressor at the panel" do you mean the service panel,
>or your tin box in the window. If it's the tin box, how do you hook it up?

Surface mount the power line suppressor on the bulkhead panel. Let's
try some ASCII art.

```
----------------------BAD DO NOT USE---------------------------------

Bulkhead
ANT----------------|s-RF---EQUIPMENT---AC-----Power
| |
RADIO GND-----resistance-----POWER GND
```

's' is antenna suppressor mounted through bulkhead

This is *bad*. Lightning energy now has two paths to ground. One
via the radio ground, and the other through the *equipment* to
the power wiring and power ground. This is guaranteed to fry
your equipment in a strike. The resistance of the Earth between
RADIO GND and POWER GND will also allow induced noise pickup (hum)
in the equipment. This is a classic ground loop.

```
-------------------------------------------------------------------------

------------------------GOOD DO THIS---------------------------------

Bulkhead
ANT---------------|s-----------RF----EQUIPMENT
```

```
|x-----------AC-------|
|| ^equal ground potentials
||
||_____________________ Power
| |
RADIO GND--resistance-----POWER GND
```

's' is antenna suppressor, 'x' is power suppressor, both mounted to bulkhead

Now there are still two paths to ground for a lightning surge, but *neither* is through the equipment. The resistance between RADIO GND and POWER GND is also effectively shorted out at the bulkhead, so the ground loop is *shorted* as far as the equipment is concerned, and no noise and hum is transfered to the equipment.

The Spectrum junk is nearly as bad as the Hamtronics. What you want
is a *GE Mastr* receiver. Bulletproof and cheap.

>Greg KD6KGW

You are right Greg, you need to be very careful about ground loops!
You have to remember, when lightning strikes your antenna (or whatever)
it induces an extremely large voltage potential in the surrounding ground.
If you have your rigs (panel) grounded at that point AND tie the ground
wire from your house wiring to the panel, you will have two grounds
with vastly different voltage potentials. Thus, a VERY large voltage and
current surge (thousands or hundreds of thousands of amps/volts) through
your
house wiring ground (probably frying everything in its path!) Not only
that,
but the insulation on your house wiring is rated at only 600 volts. The
actual
puncture voltage of the "standard" 14g house wiring is about 2500 volts, a
mere
trickle compared to what would be surging through your house wiring.
Needless
to say, the lightning strike would arc to the hot side of the AC line and
go to whatever was plugged in, not a pretty sight!

Your RG8 shield will do fine for a signal ground but not in the event of a direct
strike. For "protection" in that event you need to have #4 or larger wire. You need something that can take the rush of current and be able to dissipate
the heat reasonably well. What works even better and is cheaper than large wire is large copper pipe(1/2 inch or so.)

How do I know all of this? Experience my friend, experience! I had to replace
a tower and much of my workshop wiring because of a direct strike. I was very
fortunate not to have a fire. I was in the shack at the time, it was a very interesting experience with all of the colorful sparks flying around. I thought
I'd been hit by a photon torpedo or something!

Good luck

Kevin

4560. Any Dualband HT Mods for GMRS Band?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-27 17:44:59 UTC
From: shen@pt9229.ped.pto.ford.com
Message-ID: <369lmr$oel@pt9201.ped.pto.ford.com>
Source record: 223980

I am wondering whether I could buy a dual band HT with easy mods to expand the transceiver capability to cover the GMRS band (462 mhz - 467 mhz)? What kind of HTs are capable for that? Would the SWR be too high for transmitting in the GMRS band since the dual band antenna is tuned for 2m and 70cm ?

The reason is that I have both ham and GMRS licenses and the others only have GMRS license. I do not want to buy two separate HTs for that.

Any ideas (e-mail/post) would be appreciated!

4561. Re: Fast charging FT530 batteries?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-27 17:51:49 UTC
From: genew@teleport.com
Message-ID: <369m3l$hv1@kelly.teleport.com>
Source record: 223981

Jerry Kreifels (kreifels@intel.com) wrote:
: Does anyone know some of the technical details of the Yaesu 1-hr fast
: charger for FT530 battery packs? I'm a new ham, with a new radio,
: but I also have some experience with RC Cars, and have a peak-voltage
: detecting fast charger which I use with 7.2v 1300-1700mah nicad packs.
: I'm wondering if I can rig an adapter to use this on my Yaesu standard
: battery pack, and what problems I might encounter.

I talked to a nicad battery manufacturer when I bought my FT-530. Having noticed that batteries generally get hot in fast chargers, and having read that heat is bad for nicads, I asked the following question.
Will my batteries last significantly longer if I use only the little "ice cube" size slow charger which came with the rig? Their response: Absolutely!

My solution:
The radio came with a battery. I bought a high capacity 7.2v battery, a 12v battery, and a AA penlight battery pack. I've never needed the AA pack. When I'm on the road, the FT-530 back-charges the 7.2 volt battery from the car or motorcycle,(I make a point of running the batteries down to minimum periodically to avoid the alledged nicad memory problem). I use a power supply at home.
In short, I don't need a quick charger. I have one I bought at the hamfest the day I bought the radio. Never used it. Wanna buy a fast charger?

Enjoy your new radio. I'm spoiled. It has features I'd miss if I changed radios. Like the built in volt meter to keep check on your battery condition. I'm never suprised when it's time to switch batteries as I'm able to track their condition at all times. Not some damn idiot light which comes on to announce, "Guess what sucker? Your off the air!"
It even saved me from considerable anxiety when the alternator idiot light came on in my old car while driving out in eastern Oregon. Observing the meter on the FT-530, I noticed it still read 13.5 volts. It turned out that the FT-530 was right and the alternator fault light was faulty.

> BUT, being new to tube xmtr theory, there are some things I find
> rather puzzling...perhaps someone with one of these little
> jewels could help me understand some things:

Will try to help...am former E F Johnson dealer/ham store owner...have
built Rangers from kits and restored/repaired several under warrenty back
in the golden days.

>
> 1. How in the heck are you supposed to get a CW sidetone from
> these things? It would be nice if you could hear your keying.

The Ranger did not have a sidetone. Most commond practice was to not mute
receiver or if you did there were a dozen add-on devices to provide side
tone. Gonset built a little jewel called the Monitone that was very
popular. Also most early keyers (Eldico, Hallicrafter HA-1, etc had
sidetone built into them.

> 2. Is it possible to use my Vibroplex Brass Racer keyer/paddle
> combo without torching the Curtis chip inside?

This question confuses me. It would indicate there is a Curtis chip
inside the Ranger. If that is the case it has been added someone where
down the line. Putting an IC chip into a tube transmitter, even as well
shielded as the Ranger, was not a good idea. Should be external. The
early Rangers had a gawdawful keying voltage, they later got their act
together with a sophisticated timed-sequence-keying system which was
state of the art in the late 50's. Everyone was copying it and putting
it into their transmitters. Even at that the keying voltage could be too
high for even small reed/herm. sealed relays. The TO Keyer had no
trouble with it if wired according to their manual.

> 3. There are TWO 1/4 jacks in the back...one is for the key,
> obviously, but the other is ??? Upon putting a 1/4" plug into

> it, the main relay in the xmtr deactivates when the function
> switch is on "phone"...is this some sort of PTT switch?

The other jack is in all probability for a foot switch. I used one on almost all my CW rigs during that era...in a contest or DX pileup it was one less hassele. In fact I had a commercial Motorola dual switch and used one side for turning on spotting circuitry and the other for activating to transmit.

> 4. Loading a tube final is quite a new experience! Are you

> wattmeter I'm using? There's a trick to this, I know...what is
> it?

NEVER go for max plate current! Sorry to say the current crop of 6146's (including Bs, 6293s, etc) are not nearly as rugged as those produced when that transmitter was made. In short....you bring up the grid current just enough to get a reading on the plate meter and then dip it quicklly to resonance. Then continue bringing up the grid drive to approx. 2.5 mil or a hair higher.....we are talking conserving an endangered species here so we don't want to push our luck. Until I got to know the transmitter and it's state of capacitors etc i wouldn't push it beyond about 120 mils on the plate meter....keeping it resonant of course as you tune up. The plate current is always 'dipped' with the plate control...and increased power is done by winding in the antenna tuning until you can dip at whatever level you want.

Also be sure the idling current is set to about 40 mils or so on the plate meter....that is done by turning the bias pot. If memory serves me the very earliest Rangers had a sliding tap wire wound resistor for this, but later ones got more sophisticated.

If all goes well you have an excellent transmitter. I used it's big brother, the Viking II (had three on line at once because it took so long to bandswitch in a contest) for years. I still have a rare Civil Defense model sitting in the workshop. I loved Johnson gear with one notable exception....the (deleted) Pacemaker. That attrocity almost ruined Johnson.

For durability and enjoyment I would have to rate the Ranger as the best they built. The Viking II was more power, more rugged, but hard to tune and only a technocrat like me would appreciate the appearance of it.

:

Ok, let me restate this in terms of physical things I have/need...

Let's assume that my house was built to code, and has the 3rd wire ground
attached to a power ground at the service entry (ufer ground, right?).
Way over on the other side of my house is the "shack", complete with a wall
plug. Into that *one* wall plug I run a cord over to a "power suppressor"
which is mounted on the bulkhead, and then plug my equipment into the
other side of the suppressor via extension cords and power strips. The
bulkhead is also where my antenna suppressors are mounted, and it is connected
to my proverbial 8' stake in the ground via something wide and flat.
The ground lugs on my radios are also connected to this same bulkhead via
something wide and flat.

The one question remaining is - what is a power suppressor? I don't recall
seeing such a thing at the local hardware store, and I presume you aren't
talking about those "surge protected" power strips everyone has.

Thanks,

Greg KD6KGW

4571. Re: Any Dualband HT Mods for GMRS Band?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-28 05:07:08 UTC
From: mbrenner@csulb.edu
Message-ID: <36atls$ejr@garuda.csulb.edu>
Source record: 223995

Many radios are capable of doing what you request, HOWEVER even if you have a lisence for both bands a HAM radio is not type accepted for opperation outside of the HAM bands. GMARS is outside of the ham bands so naturally transmitting with a non type accepted radio is not leagal. You would be subject to fines and loss of both licesnces. The antenna SWR would be high for a tuned HAM antenna at 462 - 467 mhz you would have to cut it down. ALSO not that where I live and I'm sure in many other areas the police use 460.xxx and 465.xxx If you were to open up a HAM HT to transmit in GMARS you would also concevably be able to transmit in these bands where folks would really go after you! GMARS and other type accepted units are designed to prevent accedental transmission outside of frequency due to user error. Many of these units are crystal controled and the ones that are synthisized are NOT user programmable. most modern HAM radios are user programmable and we are expected to program them responcibly. Even so they usually leave the factory in a condition which does not allow them to be programed outside of the HAM bands (although you can still make programming errors which will be detrimental to other HAMS) you can't mess things up outside of the HAM bands.

I am not trying to preach at you, but as a practical matter you would be breaking the law (as well as the sperit of the self policing nature of the ameture service). Finally you wouldn't really be doing your self a favor a since you should use spearate antennas for
each band (assuming this was leagal), and GMARS radios are cheeper than a decent HAM HT. Personally if I were doing any work in GMARS I would get an inexpencive GMARS unit. (You can monitor GMARS with a HAM no problem most units have good enough sencitivity- antenna is no problem for reception).

>
> Thanks!

An MFJ 1270B is the basic bottom-of-the-line TAPR TNC-2 clone. Sells for $115 or so new. If its not too late, offer $60, as a good rule of thumb is that used electronic stuff sells for 50% to 75% of current new price. Deduct for lack of documentation, original box, rough condition, etc. You should be able to purchase a manual from MFJ, or TAPR will sell you a manual for $5 or $8 (I forget, I keep PSR at work where I won't lose them).

Currently all TNC makers sell their 1200 baud TNCs for $100 to $115. Most have features superior to the 1270B.

4573. Antenna ???'s: Longer coax or shorter antenna?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-28 07:55:37 UTC
From: dbarton@unix.cc.emory.edu
Message-ID: <36b7hp$1it@emoryu1.cc.emory.edu>
Source record: 223896

Greetings fellow hams. I have a technical question regarding the setup for my first installation. I will be setting up an SGC-2000 HF rig which will be used with an antenna tuner, and (probably) a 26' whip antenna. I would also like to set up a VHF antenna to attach to my HTX-202, and hoped for future VHF base/mobile unit.

The physical layout is as follows: The highest point on the roof is the chimney, and I would like to strap the mounting clamps for the antenna(s) to this. The only other alternative is mounting the bracket *behind* the eaves (this is a condo, and there can be no external scars when the antennas are removed in about a year). The problem is this. There is a good mounting site outside the window where the equipment will be, but that room is on the opposite side of the building from the aforementioned chimney. My question is, where is the point of diminishing returns for length of coax vs. height of antenna? If I mount the antenna(s) on the eaves outside the window where the equipment will be, I can get away with 15 feet of coax at the outside. If I mount the antenna on the chimney, I get approximately 6 more feet of height, but it will require about 60 feet of coax. I know from my fledgling study (Tech- license) that the shorter the coax the better, but how much do I gain in performance with that extra 6 feet of altitude?

A few other details of note, the building is near sea level, next to Mission Bay in San Diego, CA. There are hills close by (within 5 miles) in basically all directions, but the building has two stories, and is equivalent in height to the tallest buildings within sight range.

I do have one other question. It will likely be necessary to sink a ground rod. Assuming that I will be able to mount the antenna on the chimney, it will be an advantage to place the ground rod on the same side of the building. Is it ok to run a ground wire for the equipment back to that side of the building, or will it be necessary to sink another ground rod where the equipment will be? Is this even possible, or do the antenna and the equipment need to be attached to the same ground for safety/propogation reasons?

Many thanks for any and all help, e-mail responses are welcome, and I do check this group often if e-mail is not possible.

On the road to General class...

Doug

>Gary

I totally agree. I could tell you horror stories about Spectrum.

Look on page 72 of the Septmber 73 mag. I personally have done business
with CW Wolfe (I bought a factory 138-150mhz Micor from them, with mod
instructions to 2m) and Versatel (on the same mag page) tells you how to
convert a a $200 40w Master-II to 440 for $12! (and they have the
radios).

The GE Master II mobiles have one distinct advantage over anything
Motorola from the same vintage: the mobiles - even the 90w ones - were
rated at continuous duty at full power. The Motorola Micors couldn't do
that - the heat sinks were rated at 35w. If you turned down a 45 (and
more so a 60 or 90) watt the efficiency went down along with the power
and a 90w radio at 25w would overheat and shutdown. High power radios
belong in vehicles anyway... Converting a mobile Micor into a repeater
means starting with a 25w model, and using an outboard amplifier...
(been there, done that - email for info)...

Gary is right - get a Master II. Mount the full mobile setup to a rack
panel - control head, speaker, mic and all - just shorten the control
head cable. Note - the factory PL decks (excuuuse me - CG tone) use a
wierd little creamic tone element - the "Versatone" I think. If yours
is a tone repeater, ask for the proper tone element when you order the
radio.

PS - Try and get the GE Master-II base station book also. The 440-450 mhz
range is commercial in Europe and I <think> the base book covers the
USA & European models, where the mobile book covers the USA only.
If you are going to put the RF decks into the 440 range, it is nice to have
the factory tell you how to do it rather than try to reinvent the wheel
without the wheel-inventing tools that the factory has....

There is one 440 motorola Micor repeater that I am aware of that has a
Micor 440 receiver in it - the front end came home in luggage from
a certain ham's European vacation....

73 to everyone and thanks to read this news.

I've a TM732E from KENWOOD and I wanna make Packet Radio with this one.
I've little problem.It's that I've not found RJ-45 Mike pins values
in the documentation and so can not make cabling between the TM732 and
my TNC.

Does someone could help me ?

I have tested the TM-733A and have come to the conclusion that it is a decent MOBILE radio. Don't try to put a gain antenna on it. The front end can't handle it. Kenwood has left the receiver front end wide open so that it can receive out of band. As a result it is prone to all kinds of unwanted interference.

You didn't mention if you were interested in it's 9600 baud digital capabilities. If so, the txdelay is a bit slow.

I would like to see Kenwood do a better job on the receiver front end and tighten things up a bit. Of course if they did that then folks who buy them to work outside the ham bands would go elsewhere, but those of us who just want a decent vhf/uhf radio would have a real dandy.

I understand that the TM-733A also has some neat undocumented features as does the 732A. If you just want a good dual-band mobile rig then you'll probably be happy with it. If you don't care for the 9600 baud stuff and you don't need the remote programming features then I would look for a used TM-741.

Good luck, Mr. Phelps!!!

The pin-outs are on the schematic that comes with the radio. If you are missing yours, here is the pin-out. This does not assume any particular interface to packet, someone else may post the actual packet wiring.

1 - Dn Button (Ground to activate Dn)
2 - NC
3 - Mic Audio Hot
4 - Mic Audio Gnd
5 - PTT (Ground to Key Radio)
6 - Ground
7 - 8 VDC from radio to mic
8 - Up Button (Ground to activate Up)

Best Regards, Keith

4580. TNC (KPC-3 versus MFJ-1274C)

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-28 11:03:46 UTC
From: frode@dxcern.cern.ch
Message-ID: <1994Sep28.110346.2901@dxcern.cern.ch>
Source record: 223902

I am considering buying a TNC and would very much like
your opinions, experiences, etc.

I have read the QST review of differnet TNCs in Dec. 1993
and I have narrowed my choice down to the KPC-3 or
the MFJ-1274C. The MFJ-1274C was not reviewed in Dec. 93,
but rather the MFJ-1274B, the earlier model.

I am quite attracted to the MFJ-1274C because it is a true
TNC-2 and it has the possibility to upgrad the Mail Box RAM
to 512K. It also appears to allow for automatic mail
download from your PBBS without any intervention from the
PBBS sysop.

But some of my friemds claim that MFJ is no good, never works,
never works for long, etc. etc. Is this true or is it rather
a bad case of MFJ bashing?

>attached to a power ground at the service entry (ufer ground, right?).

It's unlikely to be a Ufer ground (that's a ground using extensive
rebar in a concrete slab). The power ground is almost certainly a
#8 wire run to the cold water pipes and/or to a driven rod (called
a "made" ground in the trade). It's unlikely to present a low impedance
to RF (and lightning *is* RF).

>Way over on the other side of my house is the "shack", complete with a wall
>plug. Into that *one* wall plug I run a cord over to a "power suppressor"
>which is mounted on the bulkhead, and then plug my equipment into the

>to my proverbial 8' stake in the ground via something wide and flat.
>The ground lugs on my radios are also connected to this same bulkhead via
>something wide and flat.

Yeah, you've got all that right. Try to have a better ground than just
a single driven rod though. Contact area with soil is what counts. Even
wire buried only a few inches is fine to use *in addition* to at least
one driven rod. For best results, ground contact should be below the
frost line for your region.

>The one question remaining is - what is a power suppressor? I don't recall
>seeing such a thing at the local hardware store, and I presume you aren't
>talking about those "surge protected" power strips everyone has.

Some of those surge protector strips are better than nothing, but some
of them are down right dangerous in a *direct* lightning strike. If you
open one up and it has coils in it in addition to MOVs, it can be hazardous
in a direct strike (though it'll offer marginally better protection from
ordinary surges induced by nearby strikes). What you want is a service
entrance protector. Polyphaser sells a great one for $600, but that's a
little rich even for me to use at home. Delta Arrestors of Big Spring Texas
sells *water well* pump protectors that work fine, and cost around $25.
These units use silicon carbide as the active element. Home Depot sometimes
carries them, and farm supply stores often carry them as well.

Mount a metal outlet box on the bulkhead (a quad box is easiest to work
with), and mount the arrestor in one of the box knockouts. Wire it to the
hot lead, neutral, and box ground. Note: these things are designed to
explode out the end opposite the knockout threads when hit with a very
heavy direct strike. Make sure that part of the arrestor is pointing in a
safe direction. I've never had one start a fire, but the explosion can be
rather violent and I wouldn't want it pointing toward people.

MOVs explode in a strike too, but they vaporize completely in typical
sizes used in surge protectors. They won't provide enough protection.
The plasma from the Delta will continue to carry the strike current
until the bolt decays, and you'll certainly know you've had a strike
and need to replace the arrestor from the mess, unlike the MOV where
you won't know unless you open the surge strip and can't find the MOV.
Adding MOVs across the line won't hurt anything, and can clip little
transients that won't trigger the big Delta. The Delta is for catastrophe
protection, not for keeping little spikes out of your equipment.

The fancy Polyphaser unit uses special heavy gas discharge tubes in a
NEMA box. It'll handle huge strikes without damage or mess, and can
catch the little transients that can wreck solid state devices too.
Of course you *pay* for that convienence. It's the only way to go in
a commercial installation.

Gary

I bought one at the York, PA hamfest this past weekend, and this
guy who was testing radios for people (Ham-Tek, Inc.) mentioned
that it was a Maxon under the RS clothing without my even asking.

I believe the story to be true. It's even about the right size
to be an IC-02AT, except it's got a better receiver than the 02
ever did.

This was one of the great inconveniences of that era. When I was using my Ranger and a Hallicrafters SX-96 to work CW on 11 Meters before it became the Citizens Band, I built a little oscillator that was keyed by RF.

>
> 2. Is it possible to use my Vibroplex Brass Racer keyer/paddle
> combo without torching the Curtis chip inside?

Not knowing what kinda transistor is used in the Curtis chip for keying, I would have to say that your guess is as good as mine. I can't remember exactly what the voltage is on the grid of the 12AU7 keyer tube in the Ranger, but it could be easily measured at the key jack. My guess is that it is just a few volts negative to possibly as much as 50 volts negative.

>

>
Not sure what this is. I believe that it must have been added by the owner. The back panel of my Ranger had the 1/4" socket for the key, a microphone jack, the coax connector, a two-pin ceramic 115vac external relay keying jack, and a 9 pin tube socket/plug with a cover on it. This latter connector was used to get the audio out to drive the big modulator to your AM kilowatt final amp.

> it?

Well, according to my memory in the Tune position you tune the Buffer tuning knob for an indication of grid current and adjust the drive control for a reading of 2.5 ma on the 0-10 scale. You would then set the meter from grid to plate, swetch to Phone and immediately tune

the final to resonance (dip) on the meter. You increase loading as you suggest, redipping as you go until you have a plate current of about 130 ma. on the 0-200 scale. On cw you should load up to about 140-150 ma. Remember to peak the grid to 2.5 ma. and dip the plate to 130 ma. and the 6146 will last quite a while provided you don't take too long doing all this.

* Three Monobanders (20, 15, and 10 Meters) for Sale *
* *
**********************************************************************

Harvard Wireless Club W1AF of Harvard University would like to sell
our three monobanders (20, 15, and 10 meters) which we just replaced
by a log periodic dipole array.

* Manufactured by TEL-REX
* Each monobander has 35-foot boom.
* A few years old
* Asking for $1,000 for a whole set
(A brand new set would cost $1,800.)

These antennas are currently on the roof of the three-story building.
Unfortunately, we can not perform disassembling or shipping for you,
so we would like you to come to our building and take them. Our
building is located at 6 Linden Street, Cambridge, MA 02138. It is
just a few blocks from Harvard Square.

If you are interested, please send your e-mail directly to me:

Message-ID: <1994Sep28.183913.206@knight.vf.ge.com>
Source record: 223906

I'm somewhat familiar with HP relays, They are not really rated for much power but their construction is robust and I beleive that any of them is good to way above 10GHz.
The ones in the 94 catalog are all rated to at least 18 GHz. Some have internal loads which are rateed for 1 watt. If you're not doing any hot switching, 20 watts should not be a problem.

Oh, I went and reviewed the specs in the catalog - some are only good to 2 and 4 GHz (or at least thar's the spec limit).

I have an HTX-202 and before I go out and buy a lot of more
expensive equipment, I'd like to optimize my use of this
dependable little HT...

So far I've added on the RS lapel mike, a few whip antennas from
various sources for portable use, and a discone up on the roof for
use at the home QTH. I see that RS is coming out with a power amp
for use with this model and look forward to that. Can any of the more
experienced folks recommend other add-ons for this unit?

Specifically, I ordered the catalogue from Down East Microwave earlier
today... can I use any of their transverters with this unit? How
about a GaasFet pre-amp? What's the best way to go for packet?

THX for any help de KC6UPU grid CM86XX.

>I believe the story to be true. It's even about the right size
>to be an IC-02AT, except it's got a better receiver than the 02
>ever did.

I love my little HTX-202, but it really has me irritated right now.

I picked up a BP-8 8v high capacity battery and a BC-35 Drop-In
Quick Charger for the unit at a swapfest. But, guess what? The
BP-8 hates the HTX-202, or the other way around.

I took it back to Radio Shack, and ALL the units in the store have
the same problem: If you are powered from the BP-8 and you transmit,
(not all the time) but all to frequently it sends the unit into the
Er2: PLL Unlock error. Turning the unit on and off again clears the
error, but it's a real PAIN!!!

Needless to say I'm a bit miffed, but the guy at the shack KNEW of
the problem, and said that the 12v battery seems to work fine, but
the 8V that I have just will not work in the HTX-202.

Anyone have any salient comments, please forward them!

Ted,
I have been using a Kenwood 742 since about the time it was first released. Nothing but good performance in my shack. Easily programmed and the circuitry is readily accessed. My set-up utilizes the raw audio (pre-discriminator) output feeding a PrivatePatch V. This gives me a cross-band repeater, autopatch, CW identifier, and switchable input frequencies. The unit is remote controllable with DTMF codes and provides the ability to change freqs, CTCSS on/off, power level, VFO/MEM/CALL, etc. Only flaw is the "ability" of the radio to pick up ambient DTMF signals in the shack which can then change the operating parameters if one is not paying attention. This only occurs when the speaker mike is the selected mode vs the PrivatePatch. The option of a third band is another nice feature. All in all, I am very happy with the purchase and user-friendliness of the radio. Drop me a line if you would like some specific info..... .....

If you can't get it from MFJ, get a manual from TAPR (they have an anonymous ftp site and a mail server). The document you are looking for is the TNC2 manual. The MFJ1270? are just commercially produced TNC2s, the manual for my 1274C is virtually identical to the TAPR TNC2 manual.

4594. Looking for my next HT...

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-29 01:29:47 UTC
From: dbarton@unix.cc.emory.edu
Message-ID: <36d5ab$87k@emoryu1.cc.emory.edu>
Source record: 223920

I recently received my license, and followed the CW (that's Conventinal Wisdom) in this and other groups and went out and bought a new HTX-202. So far I am very happy with it, but already hungry for more...

Basically I am wondering what kind of used equipment I should be keeping my eye out for. I would like my next handheld to have the following features...

1) Dou-bander (2m and 70cm)
2) All the "normal" features (CTCSS, DTMF, etc.)
3) Lots of memories
4) Auto-detect for PL tones
5) Scanner-like features (especially VHF)
6) Modifiable to transmit out of band (I don't plan to do anything illegal, but since I already have a radio that does what it is supposed to, why not wish for the moon? Besides, I have heard the stories of people who "needed" out of band capability in an emergency.)
7) Packet ready
8) Attachments available to set it up in the car.

These are the things I know to ask for. Is there anything else I should be looking for? Are there any radios that would fit my wish list here, or will I have to compromise? I read this group regularly, so I have some ideas already, but I thought I would throw the question wide open and see what comes up. :-)

Reccommendations for currently available equipment, or older models that are still supported are fine. I have a moderate amount of skill in electronics, which I am hoping to hone as I get more into the hobby.

For what it's worth, I live in San Diego, which has moderately heavy RF activity, so I am looking for equipment of above average quality.

Thanks for any help,

Doug

> deeper and find out what will work!

The Icom uses a "stereo" connector and the HTX-202 uses a "monaural"
connector. Even thought the battery packs are the same, the mic connection
aren't. Heh heh, yeah I found this out when I hooked the radio up for
packet operation. RTFM. The connections are listed in the owners book.

> never works for long, etc. etc. Is this true or is it rather
> a bad case of MFJ bashing?

Yer friends are in need of a high colonic. The best of the simple and straight forward TNC-2 clones was the MFJ 1270b. The 1274 is the same TNC with a digital tuning indicator. There have been some minor problems associated with the 1270c version.

Being a TNC-2, it readily accepts almost any "aftermarket" EPROMS. In fact they will run the PacComm PMS (personal mail system) EPROMS as well. They also are well suited to running TheNet 1.1, 2.1 and X1 versions. Or Net/Rom or the WA8DED hostmode. The Host mode is a requirement for running Eskay Packet (SP) by DL1MEN Sigi Kluger or the ARES Data system.

Go for it. If you friends have any of the "worthless" MFJ equipment, let me know. I'll take it off their hands so that don't have to be embarrased by having it in their shacks.

[stuff deleted]

: today... can I use any of their transverters with this unit? How
: about a GaasFet pre-amp? What's the best way to go for packet?

I used this rig for packet for quit a while. All you need to do is tie the PTT line to the mic input with a 2k-ohm resistor. The MFJ 1270-B TNC that I use has this built in, but with a 4.7 K-ohm resistor, and it would not key the rig. This could also be put in the cable between the rig and the TNC, so you just need to swap cables to use a different rig. See your TNC manual for what they recommend on this.

If your'e on a fringe area, some more power or an omnidirectional antenna with some gain will be a big help. I used the Ramsey 2m amp, and one of the ASA 9db verticals. I live a good distance from the node, in a hole, and the 5+ W that the HTX 202 put out didn't quite do the job.

(stuff deleted)
I still use tube transmitters. I use an electronic T/R switch. Mine
is tube type, but I've seen circuits for solid state designs. The
basic idea is that the transmitter, antenna and receiver is hooked to
the T/R switch. When transmitting, the input tube develops a high
grid bias which limits the amount of gain the tube has, thereby limiting
the RF to the receiver section. It still requires a GOOD receiver with
good AGC and overload characteristics. I use Drake R-4Bs. The
electronic T/R switch is fast enough that, with a good receiver, you
can hear between dots. And, you're listening directly to your transmitter
so if a problem develops, you know it! Some of the older Amateur
Radio Handbooks have circuits for the T/R switch. Some were
commercially built. I believe E.F. Johnson made one.

4607. FT530 Power Output and VCC Drop

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-29 14:37:53 UTC
From: tedm@btree.brooktree.com
Message-ID: <36ejg1$moq@btree.brooktree.com>
Source record: 223926

Need comments on the power output from my FT530 on 2m and 440.

FT-530 TX : Set to "Hi" (rated at 5W out). Carrier only.

Power Meter : Daiwa CN465M 15W FS, accuracy quoted as +/- 15%.

Load : 50 ohm approx.

VCC supply : Through E-DC5B lighter adapter cord , plugged into '93
Camry socket, as read on FT530 display. Increasing
alternator speed doesn't affect voltages shown below.

RX: ~12.8V
TX: ~10.7 *

Forward Pwr : ~4.5W over most of 2m
~4.0 " " " 440-450 (meter wavers slightly here)

Reflect Pwr : 0.01 - 0.15W on 2m
0.05 - 0.2 on 440.

* With an FNB-25 Ni-Cd, the Display shows 7.0V on RX and 6.3 on TX with
a corresponding reduction in output power.

Questions:

Are the large drops in VCC I'm seeing during TX likely due to drops in
the cigar lighter circuit, the cord, or the FT530 itself?

Otherwise I should get closer to 5W out on both 2m and 440 when
connected to Camry battery?

Tnx. Ted.

4608. Eto 50mhz nmr amplifier i

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-29 16:58:35 UTC
From: mutual.advantage@filebank.COM
Message-ID: <9409290958.0E0JP00@filebank.com>
Source record: 223928

The amplifier you have may be useful for its parts, but it was never designed for anything resembling ham service.

The amp was intended to drive a PA that used a pair of 8877s -- hi-mu grounded grid triodes that don't need all that much drive power. The primary design goal was ultra-linearity for a complex, pulsed, AM signal with a duty-cycle of less than 2% -- hence the 3cPx-800a7, a 3cx-800a7 modified for pulse service. The "wimpy" components are a reflection of low average power dissipation.

It's this low duty-cycle design that compromises its applicability to ham service -- unless you expect to use it for CW at 300 wpm and EXTREME Farnsworth spacing, Hi! ETO had several customers for these subsystems, but the vast majority of them went to GE Medical Systems for use in their Signa series of MRI systems, in the '86-'89 timeframe.

Source record: 223929

Help! I need some advice from some of you experts on old radios out there. I got an old (?) radio from my father-in-law and plan to restore it (although it looks to be in excellent condition). It is a Philco table top Model 46-132. It has about 6 old type tubes.

It apparently ran on some kind of battery since it has a four prong plug in type cord. It appears the battery sat in the back of the radio. Can this be adapted to run on AC with a Radio Shack type adaptor?

There is also a pair of wires that run out the back of the unit. I can not see any antenna to is it safe to assume that this is where an external antenna hooks up?

I really want to get this unit as I have heard these old radios really bring in the stations and are superior to most modern equipment.

Can any give me an idea what something like this is worth and if its worth fixing up? The cabinet is in excellent condition and everything appears intact inside (except for a battery). Also, is there any book that provides hints to these types of restorations? And can I get an antenna for it that would attach to the back? Any and all comments welcomed.

From: jbdaniel@facstaff.wisc.edu
Message-ID: <jbdaniel.2.00123B2E@facstaff.wisc.edu>
Source record: 223936

Hi-

I recently purchased this antenna and anli's magnetic nmo mount for my car. It seems to be okay. The SWR is supposedly less than 2:1 even outside of the ham bands and there is supposedly 3/5 db gain on vhf and uhf respectively. Does this seem possible? I have no reason to xmit outside of the ham bands, nor do I have the capability, but I thought that having a broad-banded antenna would be good for receiving outside 2m and 440.

Has anyone put an swr meter on this and tested it? Are (this)antenna manufacturer's claims generally truthful? Is anyone else happy with it? Just thought I'd ask.

Thanks,

Yes, it is possible. One way is to use the Curtis chip to key
a transistor that drives a reed relay. You can also key a
transistor that can handle grid block voltages. To do that, the
Curtis chip keys the base of a 2n2222 (through a 10k to 20
k ohm resistor) which in turn drives a pnp for negative grid block.

Small side point. 4CX250Bs are transmitting tetrodes. A triode number'd be
3CX<whatever>.

4615. HTX-404 comments?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-29 22:05:52 UTC
From: xenolith@halcyon.COM
Message-ID: <199409292205.AA18447@halcyon.com>
Source record: 223933

As a happy user of a HTX-202 Im considering a 404 (I live in a very high RF environmnet so RX design is paramount for me). Does it have the same strong fornt end as the 202?

Source for RS equipement? I noticed someone mentioned MaryCom but I can't find these folks advertising in any of the major US rags.

Any suggestions of place to buy this product a little cheaper than the local RS store are welcome.

I have a 1278b. With the straight 1278 and the previous version of the MFJ
software, sstv was very poor. When I upgraded to the 1278b and the newest
software I noticed a very much improved performance on ssvt. It doesn't look
as good as the Pasokon, but the mfj shows the pix full screen, while the
Pasokon appears to use a smaller window for the pix, resulting in a more
compact and denser display. FWIW

: they ever change it to be 10 meters only? I remember a rumor that Uniden
: was going to change the unit due to FCC pressure. Neat little radio. Like
: to buy another, if they are still made.

Well, they are not made at all....however, for mods, one can call a
company called Chipswitch. They have a replacement chip that allows your
HR2510 to have full repeater offsets, more memories, and (of course) 11
meter extended TX/RX.

It's $59.95, and you can contact them at 707-539-0512.

BTW, the chip also works on the HR2600....

For the upgrade in wattage, there is a resistor pot that can be tweaked
so that one can increase transmit wattage, but I am not able to access
anything of it at this time (it's at work, I'm at home...<g>), but one
gets to the point of diminishing returns when increasing the power.

4625. Need Info on HF radios for SAIL BOATS

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-30 09:10:51 UTC
From: Chris Arai <arai@rahul.net>
Message-ID: <Cwxqu4.B5n@rahul.net>
Source record: 223810

I'm looking for information on appropriate HF rigs for installation on sailboats. I am trying to help a friend install one on her boat. She is planning to cruise down to the Carribean and would like to talk oon the amateur HF bands back to the SF CA area as well as on the Marine SSB bands channels. I've heard that the ICOM 725 and 735 are popular rigs for sailboat installations, but I'm looking for all suggestions.

I'll list the questions that I would like answered:

1. What rigs would the readers out there suggest?

2. Is there any difference in construction quality (in terms of suitability to the marine environment) between the amateur rigs such as the IC725/735 and the "Marine" rigs such as the ICOM M600 or the Furuno FS1502? I know that there is a 2x - 3x price difference, what does it buy?

3. Suggestions on antenna tuners, backstay antennas and general installation info also suggested.

4. One of the things I must be able to do is modify the radio so that it will be able to transmit on the Marine SSB channels, so suggested rigs should be modifiable.

5. Where do I look for used HAM gear? I'm in the San Francisco bay area and know of the Foothill JC swap meet, but don't know when it is.

Thank you

I am considering getting a dual band amplifier to raise my HT from 5 watts to somewhere around ten time that. Are there any that are both reliable and also clean from spurii (sic?).

Here in the UK I can only find the Daiwa range but I could import an RF Concepts or something else from ther States if I am assured that this is the best route.

No, I don't want to buy an extra 50 watt mobile rig, but thanks in advance for that suggestion!

: scope is visible from the hallway, so I get all sorts of attention. :-)

What you have is a Lissajous pattern generator. It can be used to compare
the frquency ratios of two signals by counting the number of "loops" horiz
vs vertical. This I think is used to calibrate rtty setups, giving the
classic 'eye' pattern. You could also use a similar setup to trace
transistor gain curves. (horiz = base voltage, vert = collector voltage).
If you want another neat idea, connect small speakers up and tape tiny
mirrors on the cones, one speaker mounted vertical, the other horiz. Shoot
a laser off both mirrors and onto a wall. A free laser show!! Watch out
for laser safety, for your eye's sake!!!

I sometimes monitor my ham RF output to check for clipping, modulation, etc.
'Scopes are _very_ useful!!!

>Does this seem possible? I have no reason to xmit outside of the ham bands,
>nor do I have the capability, but I thought that having a broad-banded antenna
>would be good for receiving outside 2m and 440.

A broad flat SWR curve is indicative of poor efficiency in the antenna.
The curve is flat because the loss resistance dominates the feedpoint
impedance.

Yes. Open the case, prize out all those nice narrow filters, high intercept amplifiers, and other misc circuitry that prevent signals outside the ham band from getting into this fine radio and messing up it's excellent strong out of band signal rejection, and replace them with the guts from a PRO 2006. Your HT will now howl as badly as any other scanner.

In other words, this HT was designed for amateur radio, not as a voyeur's scanner. There are no modifications that will convert it to a wideband scanner which will also allow it to continue to function as an amateur radio. If you want a scanner, *buy* a scanner. Don't try to destroy the very advantage this HT has over all the others on the market.

4631. Need Info on PRR-15

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-30 14:20:45 UTC
From: lakeith@robins.af.mil
Message-ID: <36h6rt$2ua@wrdis02.robins.af.mil>
Source record: 223797

R-1484/PRR-15 Receiver

These units were made by Zenith for the USMC. The NSN is 5820-
00-082-5186.

Frequency coverage is .054 to 30 mc (AM-CW-SSB)
15 to 205 mc (AM-FM-CW)

Power required: 12 VDC. But, the unit has a dual input power
supply that will provide the required power from either a 24 VDC
or 115 VAC 60 Hz source. The power unit plugs into the case and
engages a connector in the back. In addition, a battery pack is
provided that allows the use of either 8 D-cells or 9 C-cells to
power the unit. The battery pack is the same size as the power
supply and just plugs into the same connector.

Controls include:

Volume (Off/On)
RF Attenuation
AM/FM
AGC Off/On
AFC Off/On
Lights Off/On
Bandswitch
Tuning (Large knob to tune fast, concentrically mounted smaller
knob for vernier tuning.)
Meter switch (Signal, Battery, .1 mc calibrator, 1 mc calibraton)
A Push to Calibrate Button
BFO
Antenna selection
Bandwidth Narrow/Wide

Jacks/Plugs

Whip Antenna (SO-239)
External Antenna (BNC)
Audio Out (1/4 in phone jack), 2 of these.
Microphone
Recorder

The receiver is in one case about 15x15x15 with the power supply
and the Dictaphone tape recorder with a cassette about twice the
size of a "normal" cassette tape cartridge.

Another case (same size) has the accessories to include a
headset, a couple of antennas, a microphone, the battery pack, 2

spare cassettes and assorted cables and antenna connector adaptors. Note: Not all accessory cases are complete. In the complete sets, there are three antennas, a VHF whip that looks like a tape rule, a HF whip (in sections) and a long wire..

The tape recorder is marked "Dictaphone" and uses cassettes that are twice (at least) the size of a normal cassette tape.

Although the legend above the dial window says AM-CW-SSB for the 054 to 30 mc bands, there is no SSB function.. SSB reception is accomplished in the AM mode, using the BFO.

The IF bandwidth is selectable (wide and narrow - no indication of actual bandwidth..)

I am looking for more data on these. If you have any information please e-mail me a lakeith@robins.af.mil

73,

Larry, KQ4BY

The IF232 is a optically isolated ttl to rs232 levels (+/-10v)
converter box. You can build one easily for about $25 dollars.
The chip, unless someone has cloned one, comes from Kenwood if
they have any left. My guess is that you will be happy to find
new stock at some dealer. There is a little PC board that comes
with the chip. $85 doesn't seem like a lot for this.

4634. DTMF Squelch on FT530

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-30 16:45:34 UTC
From: brianm@boi.hp.com
Message-ID: <36hfbe$cdg@hpbs3591.boi.hp.com>
Source record: 223816

Hi,

The manual for my new 530 says that with the DTMF squelch enabled
it should take 3 DTMF digits to de-squelch the radio. Indeed you
need to program 3 digits into the DTMF memory to have the radio
listen for.

When I actually send a set of digits the first and second need
to match up to what code was programmed, but any DTMF digit
on the third digit will work. This is not the case for the
DTMF paging squelch (where 3 digits then "*" and 3 more digits
are sent). All three digits must be correct for this mode to
work.

What I'm wondering, is my radio defective or is the manual
incorrect? Anyone else on the net play with this part of the 530?

73's and thanks in advance for the help.....de N6UGP, Brian sk

Source record: 223814

In Ham-Equip Digest v94-351 the following was posted:

> I am wondering whether I could buy a dual band HT with easy mods
to expand the transceiver capability to cover the GMRS band (462
mhz - 467 mhz)? What kind of HTs are capable for that? Would the
SWR be too high for transmitting in the GMRS band since the dual
band antenna is tuned for 2m and 70cm ?

> The reason is that I have both ham and GMRS licenses and the
others only

have GMRS license. I do not want to buy two separate HTs for
that.

> Any ideas (e-mail/post) would be appreciated!

The legal issues outweigh the technical ones in my mind. Type_accepted
equipment is required for use on GMRS (This means that the
manufacuter or some agency want approval of the product and able
to certify control of the manufacturing and testing process to
assure that change to the chargacteristics must submit test data
to the FCC for approval. Type acceptance is granted for specific
uses under CFR 47: In the case of GMRS the use in services under
part 95. Use of homebrew or modified equipment in the Amateur
service under part 97 is permited.

You can procure a dual band type accepted radio which will operate
on GMRS and which can also be operated on the HAM bands and legaly
do what you want. You can_not legaly modify a unit accepted by the
FCC for use under part 97 rules and use it to transmit on
frequencies outside the HAM bands irespective of your holding a
valid liscence for operation on the other service. While the
radios manufactured by many vendors for HAM use and for commercial
sales appear simular they are not identical and the HAM gear does
not have to comply with the same standards as the commercial gear!

My advice would be to buy the commercail gear which satisfies your
GMRS needs and use it on the HAM bands if you can do so with out
modifying it and voiding its type acceptance. I use ICOM U-16 in a
simular situation myself for the reasons outlined above. I want to
keep all of my liscence....<G>

Source record: 223818

I bought an AT2 at a hamfest in January. I am very happy with it. I can hit all of the repeaters with it and it works fine for me. I don't know about the extended Rx and Tx but I now have mounting problems with my transmitter (the velcro won't stick!!!) and I am thinking about hooking the AT2 up to my scanner just for grins.

>VHF band??

Here's the not-so-famous HTX-202 mod to receive out of band:

You need:
- HTX-202
- Pro-xxx scanner (fill in your favorite number there)
- Duct tape

You figure it out. :)

But seriously, everyone in the world has been wishing there was a mod for
that radio, but there just isn't one. Never has been, never will be. It's
just will not go out of band, and if anyone ever tells you it can,
please don't try any mod unless you're willing to sacrifice your radio.

4638. WTB Six Meter Gear

Newsgroup: rec.radio.amateur.equipment
Date: 1994-09-30 19:23:17 UTC
From: rvr@pacifier.com
Message-ID: <rvr.780952681@pacifier>
Source record: 223804

I am looking for a functional six meter transceiver in the 10 to 100 Watt range in good condition with documentation. I may consider the IC502 six meter portable if the price is right.
Otherwise, an IC 551, TS600, or any comparable box will be considered.

Please send particulars to rvr@pacifier.com

Thanks

If it weren't for the backlit keyboard and the voltmeter
on the display on the FT530, the W2A would be my choice
as the best 2/440 HT you can own. I've had many models.

Some dont like the battery connectors (plasic rails) but I
had no problems with it. You can mod it for 800rx and it
is very sensitive there, unlike the 530.

Sorry, not possible. The HTX-202 is designed to NOT receive outside the
2m band, thus rejecting all that crap from pagers and other nearby
radio services.

If you want to receive extended range VHF, you'll need a different
radio or a scanner.

>reception).

Are you talking about the GMRS Radio Service? And are you stating that my
Icom U-16 cost less than, say, a Yaseu FT-530?

Buying an inexpensive GMRS unit (like the Uniden GMR100 or the Radio
Shack unit) is a worthless purchase - IF you ever intend to access
repeaters that offer public assistance. You need CTCSS and at least
a watt to hit our system in SoCalifirnia - the Repeater User's Group -
on 462.675 with a CTCSS tone.

Fred Towers (ftowers@richmond.infi.net) wrote:
: Has anyone gotten a Motorola Spectra working on the 902-928 MHz
: band? If so, would you please post (or send to me by e-mail)
: the modifications required?

I sent two out to a guy in new jersey who had the software to program
them to the ham band. This guy uses syntor x conventional on the ham
band.
One of our spectra was trunking only, the other
had only one conventional channel. Only conventional channels can be
programmed to the ham band. Then the VCO needs to be adjusted to lock
up. And of course the rx front end & pa need to go thru the works too.
An immense pain.

I found the company in san diego call RF Neulink (also RF industries)
which is known for rf connectors/adapters. They have new transmitters &
receivers for vhf/uhf/900mhz. they are crystal controlled. They have
another model for 900mhz which is synthesized.

4656. HTX-202 caveat

Newsgroup: rec.radio.amateur.equipment

Source record: 223831

Until recently I thought I was the only one to encounter a weak-link in the '202 but have since talked to three others who had the same experience.

To wit: In removing or replacing the battery case it is very easy to crack the thing ridge of plastic on the lower front panel. At first appearance this looks like a bit of trim to cover the metal guide rails for the battery....wrong! This holds the entire battery pack in position to prevent lateral movement. Once cracked the battery case "wobbles" and DC voltage contact is intermitent. A call to Tandy resulted in a price qoute of >>$78.00<< for a new case! At present a very strong, very wide rubber band is holding the trim in place until I decide what cement I want to use on it. Mine broke as I was sliding the pack off....others have said theirs broke sliding it on. It appears any slight misalignment puts pressure on this extremely this strip of plastic...then zap.

Icom IC-735, with an AH-2 antenna tuner. Look around it is a simple 2
diode mod to make it "transmit out of band". Plan on having it taken
away from you if you insist on using it instead of a type accepted
marine band radio. Hang out on rec.radio.swap look at the local swap
meets. Keep an eye on the consignment shelf in your ham stores.

It is a simple yet very effective piece of equipment from Icom that does
exactly what it is supposed to do. Work well.

Has anyone sucessfully reduced the amount of intermod that the Kenwood TM-732 exhibits? The UHF side is practically unusable in this city. I have detuned the rf section for limited help. Has anyone removed the first rf amp?

Thanks in advance.

Also useful. It's absolutely AMAZING how often ... perhaps once every other month ... I do this while listening to the radio and discover my favorite station transmittin in MONO!!! It's always fun to call them and tell ... they NEVER notice, and it's better when you say that you see that embarassing straight line on the scope. Do radio stations ever actually monitor their own signals? Are the people doing it incapable of telling by listening (I sure can tell).

>radio side.

It wasn't a real BP-8 pack, but rather an ICE pack. But after much
more playing around, and finding a REAL BP-8 pack, we found the real
problem.

The ICE pack was allowing RF back into the radio somehow. If you held
the unit well away from all surfaces it would work fine. If it was
close enough to your body so that you acted as a ground plane, or put
it on a metal surface, it would ALWAYS error out. If you hooked it up
to an antenna that did not need a ground plane, or an external antenna,
it would always work fine.

Moral of the story? Test before you buy. I'd recommend the rubber
duck that comes with the unit, holding the base of the unit up against
your chest perpendicular to the radio such that you become the ground
plane. If it works fine that way, chances are you are in the clear.

>- Duct tape
>
>You figure it out. :)

ABSOLUTELY WONDERFUL! :) And they said it couldn't be done.... ::))

>But seriously, everyone in the world has been wishing there was a mod for
>that radio, but there just isn't one. Never has been, never will be. It's
>just will not go out of band, and if anyone ever tells you it can,
>*please* don't try any mod unless you're willing to sacrifice your radio.

You know: If someone did find a mod somehow, the first person to do it
would then complain about how it increased the intermod problems. :) But
I guess it just doesn't sink in with some folks that the RS design is a
GOOD thing for a 2-meter only rig.

From: grsnow@wpi.edu
Message-ID: <36n76r$d5o@bigboote.WPI.EDU>
Source record: 223847

I am looking for a modification for a friend. The official model
number of the radio is:
Kenwood TH-241a th2 K2

He says the mod for the TH241a that he has to open full TX doesn't seem
to work on his rig... So the only mod he currently has opens the TX
for MARS/CAP only.

If you have any mods for this radio please post them.

Thanks,
Gregory R. Snow (grsnow@wpi.edu)

The TM-732 is designed to be a MOBILE radio. The frontend is pretty much wide open. Therefore, when you hook it up to a gain antenna the front end folds up like a house of cards.

A friend of mine has had the same problem you are with his TM-732 and corrected it by using an external antenna tuner designed for two meters. He tells me that the UHF side of the radio doesn't have the problem that the VHF side does.

I have personally tried out the next generation TM-733 and it has the same problem. I have just used one on a base station gain antenna though. I understand that they work okay in a mobile with a lower gain antenna. Of course the guy who told me that was trying to sell me the radio.

Good luck, Mr. Phelps!

4677. Re: Solutions to TM-732 Intermod?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-03 02:03:01 UTC
From: prvalko@vela.acs.oakland.edu
Message-ID: <36nool$5fc@oak.oakland.edu>
Source record: 223851

I bought my 723a the first day they were available in the US two years ago at Dayton. The UHF side was virtually unusuable in Detroit. I sent the rig back into Kenwood to see what they could do with it under warranty. Whatever they did (and I *think* it was to de-tune the UHF front end) worked fine.

4678. Re: Viking Ranger Xmtr

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-03 02:06:38 UTC
From: jimh@w8hd.org
Message-ID: <36nove$4a3@w8hd.w8hd.org>
Source record: 223854

I thought I would add that the Johnson Viking Ranger
was sold both as a kit and an assembled and tested
product. If the one you are working on was a kit
built model, you may see a few modifications, like
the extra 1/4 in. phone jack you describe. I don't
recall my Ranger having that.

If the final is well neutralized, you should see
a peak in grid current occur with a dip in plate
current.

The outstanding feature of the Ranger was its attention
to sheilding. It was constructed with prevention of
TVI in mind.

It was also an expensive radio; I never had one until the
early 1970's, at which time they were selling for less
than $100. That was quite a bit less than their initial
price in the mid-to-late 1950s.

Best regards,

de K8SS

4679. RF attenuator on old Ten-Tec ARGOSY?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-03 02:07:37 UTC
From: dgf@netcom.com
Message-ID: <dgfCx2r8p.C7B@netcom.com>
Source record: 223852

My old (new to me) steam-powered ARGOSY (not Argosy II) has no RF gain control or RF attenuator on it's front end, and is getting crunched on 40M (I have 2 elements on 40 at about 60' and it seems to be getting confused by local broadcast stations).

Anyway, I heard somewhere that there were "mods" for this situation. Before I hack in a switchable RF attenuator, could someone direct me to clues as to what to do here?

4680. TM-733A.DOC (Release 2.0 10/1/94)

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-03 02:41:00 UTC
From: n5ljv@uh.edu
Message-ID: <2OCT199421415175@elroy.uh.edu>
Source record: 223853
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

Here's the updated TM-733A.DOC. It contains some new and interesting info.

Modifications, Undocumented Features, and Bugs for the Kenwood TM-733A.
Release 2.0 Updated October 1, 1994

Updates for Release 2.0 are identified by parenthetical statements.
There is also some new information sprinkled throughout the previous material
either to update it, to correct misinformation, or to be more specific.

This document is a compilation of Internet messages from
Steve Haehnichen KE6JGK and Brad Killebrew N5LJV, edited by Brad Killebrew.

Extended RF Modifications

Refer to diagram below. (Inserted into Release 2.0)

Remove power source from the radio.

Remove the display panel.

Remove the top cover the radio.

Face the front of the radio away from you.

Remove the speaker.

Looking from the back of the radio, the control board is vertically
mounted just behind the front panel wall (which can be removed easily
if better access is needed.)

Just to the right of a chip labeled XRU4066BCF and just to the left of
two green wires (B2 & B3 which are draped over the board to the rear) are
two zero-ohm SMT resistors, B0 and B1, marked "000".

Remove B0. (the one on the left - furthest from the green wires)

Taking it out might be a bit tricky. It's glued down for surface-mount
assembly. Be careful not to pull the trace from the board.

Perform a CPU reset by holding [MR] while turning on the radio.
It will then ask if it is "OK?" to reset, press [MR] again.

The ranges after modification are as follows:

Tx: 136-174 410-470
Rx: 118-174 300-470

The cellular band is indeed missing.

ONLY Removing Jumper 1 (B2) is the MARS/CAP modification.

** Diagram of specified area on Control Board **

EDGE OF BOARD, viewed from the rear, looking toward front panel

Green jumper wires (B2, B3)

The jumpers are actually soldered on the other side of the board,
but the loops come up over the top and hang over the B0/B1 side.

B0=R414
B1=R412

Here's something interesting! According the Kenwood rep I spoke to,
performing this mod *does not* void your factory warranty. The same
goes for any Kenwood published service bulletin or modification info.
We are encouraged to perform the repairs ourselves to save them the
trouble and expence.

DTMF Remote via Microphone

The TM-733 is fully DTMF remotable via the microphone (documented).
The radio can also be externally DTMF controllable with an HT, but that
will be described later.

The DTMF control keys are exactly as shown on page 81 of the
manual. Note that the microphone is active all the time, so any
ambient DTMF tones near your mic will also change rig settings. This
includes tones coming in on the other band and out the speaker.

Cross Band Repeating

Cross band repeat isn't documented but comes ready from the factory. To enable cross band repeat from the front panel, first select a band by pressing BAND SELECT. Then, change the control to the other band by hitting [CONT SEL]. Next, press [F] for one second, then the "X" button (far right side). Decimals will appear between the Kilohertz digits, and the "ON" indicator will light momentarily. The microphone sequence to enable cross band repeat while in remote control mode is "DC".

The transmitter hang time can be toggled between 500ms to 0ms by turning on the radio with [LOW] pressed. They also recommend enabling the Time-out Timer, for obvious reasons.

Note that the TM-733 can also be used as a "one-way" cross-band repeater. For example, if you can receive a distant repeater with your HT, but have difficulty getting into it, you can use the TM-733 to boost your transmitted signal. To set this up, just omit the part where you "change the control to the other band by pressing [CONT SEL]." Doing this will setup the TM-733 to repeat your signal to the other band, but will not retransmit the distant station back to you. If this sounds ambiguous, play around with it a little and it will begin to make sense.

DTMF Paging and Squelch

The DTMF Paging & DTMF Squelch protocol (AAA*BBB) is compatible with the Yaesu 530 and all Kenwood radios supporting this.

DTMF Monitor

There are some serious bugs in the "DTMF Monitor" feature (Page 63: [PTT] + [DWN] + Power On). This feature supposedly lets you hear the DTMF tones you are transmitting. The first problem is that it only gives you a short tone from the internal speaker. This is not true to the transmitted tone that lasts as long as you hold the key. The much bigger problem is that it mixes the desired tone and the feedback tone resulting in an almost indecodable DTMF tone. Kenwood is aware of this bug.

(Updated information for Release 2.0):

Per Ricardo, a Kenwood technician, they are aware of this bug and are working on a fix. No details yet.

Front Panel

There are two undocumented icons on the display; one is the "heart" symbol. Anyone know what that's for? It could just be a spare. I noticed they used the odd "spade" symbol to indicate AM receive, so maybe these were last minute extras. Dunno..

From looking at the schematic, it seems that the only programmable memory is physically located in the detachable front-panel. I think this means that if I use my front-panel on someone else's radio, I get all my memories and settings. Anyone try this?

The whole front panel is connected to the rig by four wires (yep, including the volume/squelch pots.) According to the schematic, these are: power, ground, data in, and data out. I'm wondering how hard it would be to make a PC interface for this thing and replace the whole display and controls with a full-screen version. It wouldn't surprise me if many of the programming limits were also imposed by the front panel, and not the unit.

Wireless Cloning

The advertised but undocumented Wireless Clone function is described in App Note AAN-0008 which they will mail out on request. (Maybe if enough people ask for it, they will include all the functions in future instruction manuals.) In summary:

- Prepare the two radios for simplex operation on the same frequency.
- Turn both radios off
- Press [CALL]+[SHIFT] + [Pwr On].
- This should place the radios is clone mode with "CLonE" on the display.
- Press PTT on the "Master" radio momentarily. This will start sending the programming DTMF tones.
- After all data has been transferred, the display of all radios will read "End", indicating success.
- If the signal is interrupted or corrupted, the "Slave" displays will read "Err". Turn them off and try again.

Notes:

- Both the Master and Slave radios must have the same number of memory channels available for each band. Example: You can not clone a stock Master to a Slave with ME-1 memory expansion.
- You can not clone between different Kenwood radio models, even if they seem identical.

Be careful when using the clone feature. It has been known to wipe out or scramble memories on the master radio during or right after clone.

Bugs and Problems

To date, I have logged two trouble reports with Kenwood.

The first is the well-known problem with the transmitted PL (CTCSS) tone. The tones are filthy. They contain many harmonics and synthesis noise. I'm guessing this is because they are using 7-bits from the CPU and a resistor net (DAC) to synthesize the tone. The sound/intensity of the

noise depends on the actual frequency being generated. The PL tones also come out of the radio's speaker while transmitting. Weird, but not a problem.

The PL noise seems most messed up (on my radio) at 107.2 Hz, where the noise beats with the tone. Go simplex and ask someone to describe the noise to you, or listen carefully to your own speaker while transmitting. Some repeaters do a better job than others of hiding the noise for you.

(New information inserted into r2.0):

==========
Transmit PL Fix
==========

Kenwood just released a Service Bulletin to address the transmitted PL tone noise on the TM-733A. (Yeah!!) Call the Kenwood Service Dept. (1-310-639-7140) if you want a hardcopy. Here's a summary of the text. Use it at your own risk. If you are going to get into your radio with a hot iron, you should first get the real paper from Kenwood with the drawing.

Kenwood Service Bulletin #ASB-1060 2 Pages
Subject: TM-733A PL Tone Distortion August 30, 1994

Symptom:

Transmitted PL tones at the receiving station have a relatively high level of distortion. This is easily seen when the incoming signal is viewed on an oscilloscope.

Countermeasure:

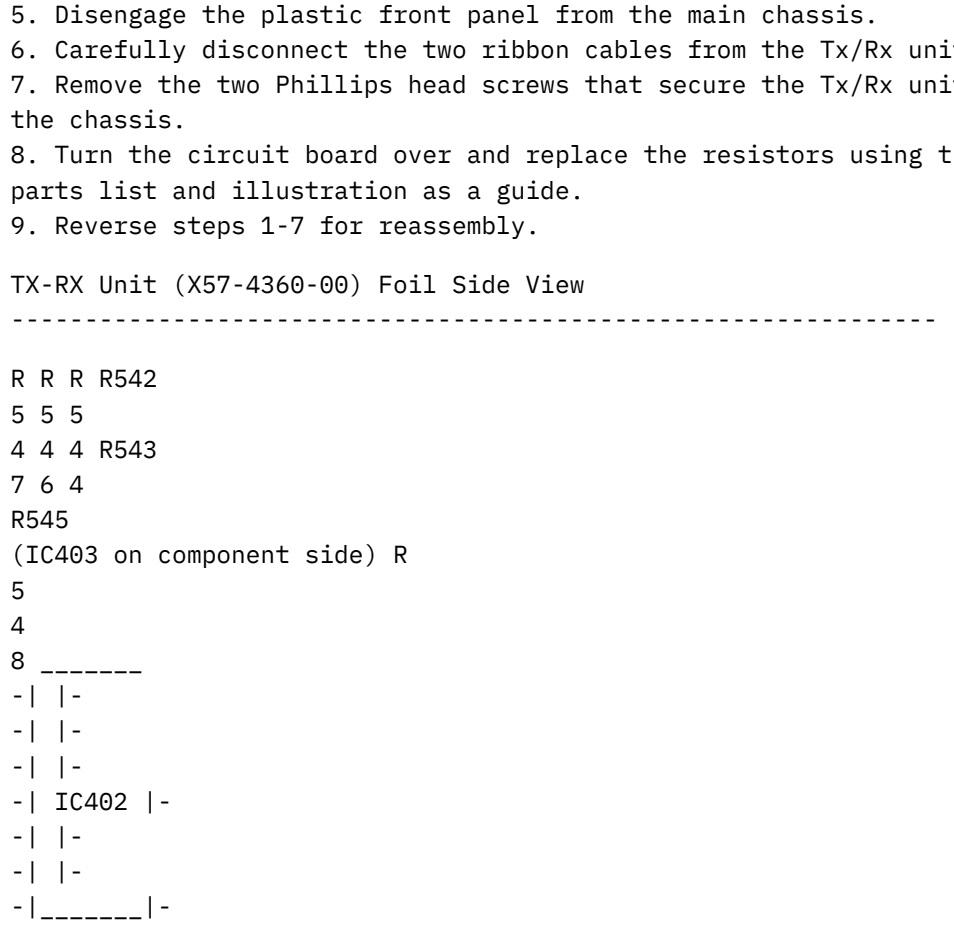
Change the value of the "Pull-up" resistors in the PL tone encoder circuit as shown in the accompanying chart and illustration. This reduces the distortion from around 9% to approximately 4%.

Part	OLD value	NEW value
R542	1.8k	2.7k
R543	1.8k	3.3k
R544	1.8k	4.7k
R545	1.8k	6.8k
R546	1.8k	10k
R547	1.8k	10k
R548	1.8k	10k

Procedure:
---
1. Disconnect the power cable, microphone and antenna's, etc.
2. Detach the front panel and set it aside.
3. Remove the top and bottom covers.
4. Remove the speaker and speaker mounting bracket.

5. Disengage the plastic front panel from the main chassis.
6. Carefully disconnect the two ribbon cables from the Tx/Rx unit C/4.
7. Remove the two Phillips head screws that secure the Tx/Rx unit to the chassis.
8. Turn the circuit board over and replace the resistors using the parts list and illustration as a guide.
9. Reverse steps 1-7 for reassembly.

TX-RX Unit (X57-4360-00) Foil Side View



Caution: This modification requires advanced surface mount soldering equipment that is rated for CMOS circuits. It also requires familiarity with advanced surface mount soldering techniques. If you do not have the proper equipment or knowledge do not attempt this modification yourself. Seek qualified assistance from your closest Kenwood Service Center (Long Beach, CA, or Virginia Beach, VA).

The Service Manual specifies a test for the PL. The technician is simply required to verify that any one PL tone is between 500 and 1500 Hz deviation. This is quite a wide tolerance range! The "standard" PL tone deviation should be 750 Hz. Twice that strong might be too strong and become audible. There are no trim-pots on the PL deviation, so I'm guessing that the deviation is pretty constant from radio to radio.

The dirty PL is definitely found on early models, but we have had many reports that the PL problem has been fixed in newer versions of the radio. If you purchased your radio after September 15, 1994, (or your serial number is greater than 55000000) it's a good chance that you may not have the PL problem.

The other problem concerns the DTMF Confirmation Tones. This feature is off by default (I wonder why :), while it seems pretty useful. To turn it on, press [PTT] + [Down] on the microphone while powering the radio on. This will generate short DTMF confirmation tones whenever you send DTMF over the air from the keypad. Unfortunately, it mangles the beginning of the outgoing DTMF tone! This is serious enough that most local repeaters can't detect the tone, or count it as two tones.

Get a receiver and listen to what you are sending out when the Confirmation tones are enabled. It sounds to me like they may be mixing the confirmation tone in with the real tone and getting some destructive interference. Just a guess, though.

I called a Kenwood technician (Ricardo) and worked with him on the phone to reproduce the problem there. So, as of today, this is a Known Problem, and they are looking into a fix. :-)

I am really curious to know what they would say if other folks called up and complained about this problem. Would they deny hearing about it, or would it really be a Known Problem? Might give some insight into the PL-noise denial thing anyway. :-)

Personally, I'm much more concerned about the noisy PL than the DTMF confirmation tones, since I can just shut those off and pretend that feature doesn't exist. If enough people call about the PL problem, maybe they will come out with a real fix and offer it under warranty to all the radios out there (since they're all pretty new). My guess is that it will involve a free TSU-8 tone decode module, but don't hold your breath. :-)

External DTMF Remote Control

The following procedure places the 733 in External DTMF Remote Control.

Note that this mode is different than DTMF Remote Mode. This mode concerns the control of the 733 with an HT, and not the microphone.

- Press Band Select and select the UHF band.
- Pick a UHF control frequency.
- Turn on the UHF DTSS function and select a tone sequence. (p. 89)
- Turn the UHF DTSS function back off.
- Press Band Select to move to the VHF band.
- Press [CONT SEL] to move control back to the UHF band.
- Turn OFF the radio, press and hold [CONT SEL] while turning the radio back on, then release [CONT SEL]. The S-meter scale and the DT indicators for the UHF band will begin flashing. The LOCK indicator will turn ON, and most front-panel keys (except PWR) will be disabled.
- To begin remote control, you should key the external radio and press the following key sequence: "Axxx#" where "xxx" is the preset DTSS code selected earlier.
- If the proper code is received by the 733, the beeper will sound and the DT indicator will stop flashing. The radio can now be

remotely controlled using the function chart below.
- To return to standby mode, press "A#" on the remote radio.
- To return the radio to normal operation, turn the radio off, then press and hold [CONT SEL] while turning the radio back on.

Refer to this chart when using the TM-733 in "External DTMF Control".

1 2 3 A
T.ALT ON TONE ON CTCSS ON ENTER

4 5 6 B
T.ALT OFF TONE OFF CTCSS OFF TONE SEL

7 8 9 C
CALL VFO MEMORY REPEATER ON

* 0 # D
DOWN POWER LEVEL UP REPEATER OFF

There are no "shifted" functions. Just one function per button.
After you hit "B" for TONE SELECT, press * or # to go up or down, and same is true when in VFO mode or in MEMORY mode.
Tones 7, 8, and 9 mimic the three buttons at the top of the 733 mic.

Pressing "C" places the radio in cross band repeat mode. You will recognize this because of the dots between Kilohertz digits.
After pressing "C", put the radio back into standby mode with "A#".
The 733 will now cross band repeat. To disable cross band repeat, place the radio back into the External DTMF Remote Control with "Axxx#".
If you can read through the lines, the 733 is capable of operating as a frequency agile remote base. Now Kenwood just needs a CW IDer!

Assembly Mode Test

In the TM-733 Service Manual, it describes a test mode that I haven't seen mentioned anywhere else. So, here's the scoop:

Entering Assembly Mode: [CALL] + [MUTE] + [Power On]
All LCD segments should come on. (To exit, power off.)

Press the [VFO] key. *This must always be done first*
The serial port is checked and "F" with "80" on the display indicates test passed. "1" or "2" means failure.

Different keys now show different displays, with [LOW], [SHIFT], [TONE], and [REV] also adjusting the backlight intensity.

Set the dials to minimum, then press the [MR] key. Each of the dials shows the digitized level.

This looks useful for checking all the keys and dials when you suspect a bad connection.

----------snip here and print----------

Kenwood TM-733A Quick Reference Guide by Brad Killebrew N5LJV

[#] PRESS A NUMBER, NOT THE POUND SIGN.
[KEY] PRESS AND RELEASE [KEY]
[KEY1]+[KEY2] PRESS AND HOLD [KEY1] DOWN, THEN PRESS [KEY2]

Ba> father is looking for a first time rig and I'm not sure what this rig
Ba> can do. Any comments pro or con about this equipment as a first rig?
My first real radio was a TS-520SE when I was a kid (first one was a
Swan 500C - Not a good first radio). The TS-520SE from what I understand
is the same as the TS-520S except it does not have the 12V capabilities that
the 520S does. I worked so very well for me that I regreting selling some
years later. The only reason I sold it was that I bought a TS-440S and
wanted a radio with a general coverage rcvr. Excellent choice for a
first rig in my opinion.

I have a TM-731A, a TM-431A, and a TK-805. The latter is the Kenwood
commercial version of the ham TM-431A. The UHF receiver in each of these
radios is nearly identical. And yes, they all fold in downtown anywhere.
The only solution I have found is to ALWAYS use receive CTCSS. Of course,
you have to talk everyone you want to QSO with into always transmitting the
same CTCSS tone. Even with CTCSS, it will still get hits from intermod
which happens to have the CTCSS tone you are using.

Please let me know if a real fix is found!

It is marginally better than dung, IMHO. It suffers from incredible intermod
problems. The tuning adjustments inside are not staked so from time to time
you hear cores from the 450 resonators rattling around inside. The antenna
connector has a habit of coming loose unless you locktite it. If you do locktite
it you cannot get in to replace the surface mounted lights for the LCD panel.
The microphone jack "ground" lead is not connected to anything. All in all it
is a marginally useful incredibly sensitive piece of <wanna buy mine?>

From: vancleef@netcom.com
Message-ID: <vancleefCx39DK.n1q@netcom.com>
Source record: 223860

I keep hearing about Hammarlund receivers for sale for "make offer" prices, and don't know what the details of various models are. I tried e-mailing to the boatanchor mailing list (which I have to ftp to get) but no dice. Evidently my mail won't distribute to the list.

Can anyone give me something of a rundown on some of these boxes (I assume they are all boatanchors).

HQ-100, HQ-129, HQ-150, HQ-180.

Thanks in advance.

4687. FT-530 VOX / mic compatibility

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-03 10:01:30 UTC
From: thooker@psl.nmsu.edu
Message-ID: <thooker.56.000A06BD@psl.nmsu.edu>
Source record: 223871

I have a friend who has an FT-530, and one of those Genisis throat mics. It will not operate on VOX. The 530 manual states that the Yaesu mic will work with VOX.

Does anyone know what the Yaesu mic schematic is, or why it works on VOX and other mic's dont?

Thanks,
Tracy

Source record: 223862

Hi,
74188s are PROMS, so as well as new parts, you will need to program them with the original data. These are the same as 82S23 or 82s123, I can't remember which. But they are 32 x 8 bit proms with open collector outputs. They are getting harder to find, since Digi-key discontinued them. I think I saw some in a recent Hostfeldt Electronics catalog for about $4... You will need to find somebody with a programmer that can program these antique parts.

Good Luck.

Jeff.

Hi all.

I have recently aquired (ham fest) a used Azden mobile 2m radio and am in need of getting in touch with Azden itself to see if I can not get a copy of the manual and a copy of the schematic for it.

Could some one please mail me the address for Azden.

Thanks.

Message-ID: <hpaik.101.2E900FDA@silver.sdsmt.edu>
Source record: 223865

I have Alppha 76PA (3 x 8874). I am using 110VAC.
I can have around 1300W continuous carrier power output.
I may able to get some more output, but my circuit breaker
is going off or 76PA's fuse is blown.
One guy told me he could put out way more than 1500W on his Alpha
374 (3 x 8874). Another guy said the similiar thing.
Max current on 8874 is 350mA. Max plate voltage is around 2000V.
(When mine puts out max, total plate curent is around 1000mA and plate
voltage is just above 2000V).

My qustion is what is the maxmum power you can get from Aplha ?

Well each to their own. I've found the opposite with respect to intermod.
I can use mine in the car with an external antenna and travel past some of
the better known intermod generating paging towers without a hint of intermod.

As the tuning adjustments, etc., I can't say. The antenna connector is a
bit of a problem (as is finding a replacement one as it is the less commonly
found rear panel mount BNC.)

Also keep in mind though that the radio is a few years old and lacks all the
bells and whistles of current day rigs such as memory dialing and DTMF
paging for those that like to use their HT as a car phone. ;-) Also
its out of band receive capabilities are rather limited compared to many
of the DC to daylight receivers found these days (perhaps why I believe they
exhibit less intermod contrary to David's experiences.)

Just my 2 cents worth.

73,
Todd

: about a GaasFet pre-amp? What's the best way to go for packet?

HT's rarely benefit from a GaAs FET preamplifier, unless your have
a long run of cable between the antenna and the radio (100 ft). In
this case, a mast mounted preamplifier may help.

There are two difficulties in using a transverter.

With many systems, it is necessary to switch between transmit
and receive. You may have to modify the HF to provide such a
signal, though RF sensing is possible (I don't recommend it,
since you typically have to clip off some of the transmission
to accomplish it). I don't think anyone sells a box that senses
RF and tells transverters to switch. Some HTs, like the Icom
2AT, actually put a DC signal on the antenna connector for
switching amplifiers that can be used to switch transverters.

The second is having sufficient activity to make the effort worthwhile.
Much of the microwave activity is on SSB/CW, which is a rather difficult
to make compatible with an FM tranceiver. Some people, including myself,
can usually switch to FM if asked, but there are some who can't.

But, there are some places with regular microwave FM activity--ask
the people in your area. Or, get a couple of friends to generate some.

4696. SBE SB-450 TRC Info Needed

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-03 15:20:56 UTC
From: jeff@sec.sel.sony.com
Message-ID: <36p7go$a6u@usenet1.sjc.in.sel.sony.com>
Source record: 223869

I just picked up a SBE SB-450 TRC. It seems to be a 2 meter to 450MHz transverter. It was imported from Japan by Linear Systems Inc. in Watsonville, CA.

The only thing missing was the crystal. I need to know the local oscillator frequency. Any other information would be helpful. Operations manual and or schematics would be appreciated.

Thanks,

Jeff

4697. Advice sought: Blown finals on HR2600

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-03 16:22:25 UTC
From: physbs@muccmail.missouri.edu
Message-ID: <physbs.178.00106022@muccmail.missouri.edu>
Source record: 223881

I would appreciate any help on this one.

I picked up a used HR2600 with an installed chipswitch a little while ago. I suspect that the finals have been damaged by transmitting at high SWR. Does anyone have any advice on how to fix this.?

Does anyone have a schematic that they could .GIF or FAX me. Components seem pretty cheap, maybe I should just go ahead and replace the suspect components on the final output circuit (but which ones ?).

Thanks,

> Wide-band receive plus AM aircraft. 5 Watts (12 V battery)
> is standard. Any one have any opinions on this unit or
> Azden in general? Thanks.
>

I reply:
I have the Azden 6 Meter handheld and am quite happy with it. I would question though, whether
to buy a "commodity" item like a 2 meter rig from Azden when you can buy a rugged, immune to intermod
rig such as the Radio Shack HTX-202, or a wide-band rig from Yaesu, Kenwood, Icom, or Standard. I see
two big problems with the Azden rigs (2 and 6 meter)....

1) Difficult to program.

2) Batteries and other accessories are pretty non-standard. I believe that you can't buy a replacement
battery pack from E.H. Yost or any of the other third party vendors.

On the plus side, I've had very good luck with the 6 meter rig in terms of reliability and performance.
6 meter rigs though are VERY rare, and I was forced to go to the Azden because no one else offers a 6
meter handheld. I use a Yaesu 530 HT for 2 meters and 440. Does wide-band receive, crummy in terms of
intermod rejection however (as all wide-band capable rigs are).

Hope this helps,

Fredric Einstein

Is he/she using an earphone too? I'm pretty sure vox won't work without also
plugging in an external speaker (the intent being to avoid feedback).

The only Yaesu mic I know of that works with vox is the headset.

Hope this helps,
Tom

Hi,
And thanks for reading my post, I recently purchased a NC37 quick
charger this past weekend at the Boxboro Hamfest. The unit came without any
manual, I am wondering if someone could tell me a little bit about the unit
such as max. charge time and also what does it mean when it is trickle charging ?.
Is it safe to leave the battery in the charger when it is trickle charging?.
I don't want to damage the nicad's, any help would be great!

Thanks de Keith aa1jf

Message-ID: <johnp-0310941538280001@shipping.ipctech.com>
Source record: 223877

I had the Alpha 78, 3 8874's and ran it 220v. I was hitting it with a 100w solid state radio, so the actual drive power was less than 100w I would imagine. Anyway, output on 75 & 160 meters was about 1800-2000 watts PEP and less on the upper bands as read on an inexpensive Yaesu power meter. I did run it on 110 for a short period and got similar performance but had to put up with the lights dimming pretty bad. If I were you, I would get a 220 volt line installed. Dont worry squeezing every possible amount of power from it as it is not going to matter on the other end anyway. Also read your manual and watch that you keep the grid current well below the max. as those tubes run between $275-$400 new

>> Can you confirm or deny this ? :-)

The HTX-202 is based on the ICOM 02AT with certain design
modifications based on Tandy's specs. These variations include
the encode/decode, additional memories, and a full width LCD
display. Contrary to rumor, no part of the radio is Kenwood or
Yaesu! ICOM sold the rights to their design to Tandy to do with
what they would.

Whan Tandy sought to produce the unit, they went to their usual
Korean source for cheap gadgetry: MAXON. Maxon then built the
HTX-202 for Tandy, under license from Icom. The HTX-202 is
surprisingly sturdy, and well constructed, considering that
Maxon's Quality Control has, in the past, been suspect.

The following was posted on comp.robotics and sci.electronics.
I would like information about who makes these boxes and where
they are available? Also, is the price $10 real or a typo (maybe $100?)

73.
Balu

: : I use LAWN boxes for this type of application. They can be had at
: : $10 a box at most HAMfests. They have a channel width of 38400 baud, but
: : due to protocal they can only achieve a 19,200 baud throughput. They also
: : have a little bit of a lag in transfer. This can be disasteris in some
: : control applications.
: Do you need a HAM license to use these boxes? SS at 900MHz does not, I think.
: Can you provide more info on LAWN boxes?

900 MHz band is allocated for the use of HAMs and commercial low power
applications. Since Spread Spectrum needs much less signal power it falls
under the power considerations for, and the FCC has specifically assigned this
type of application to 900 MHz. HAMs are allowed to run more power though.

The LAWN boxes are white bricks. They have four LEDs on the front
and a RS-232 port on the back. The radio is 900 MHz SS. The internal
protocal is AX.25 (modified), and the antennas are also internal and of
two different polarities (it switchs as needed). You provide 12V at 200+mA
and a serial port connection, and it just goes.

73,
Shawn

Hello out there

just bought an kenwood handheld trx th79e. it is a fine handy,
but i wonder if there is no charger build in.

the dealer said, the accu is automaticly charged and controlled not
to over charge it! the manual says the opposite!

now the question: may i leave the accu in the trx while operating with it?
cause it damages to it if i put the trx inclusive the
battery in it on a dc-surply all the time?

please answer
thanks so long

ps:the following text is from the internet and from packet radio
in which i collect any information about hidden functions in the TH79.

enjoy it!

CHANGING THE BANDS:
==========
Press the F-key andthen press the LOW-button to toggle between Air-Band
(340Mhz on the VHF Band) or the Phone-Band (850Mhz on the UHF band) and
the amateur radio band.

CROSBAND-REPEATER:
==========
The TH-79 does go into X-Band repeat. Press the "F" key then the "MONI"
key to enter repeat mode. Use the same to return to normal. There is a
10 min transmit limit so it's not useable for long duration monitoring of
a continuous transmission. That's understandable in light of the number
of horror stories I've heard of people frying their HT's in repeat mode.

CLONING THE TH79E
==========
To clone the memory contense of two radios on the air. The clone procedure
is same with all others. (use of DTMF tones, do not disturb transmission
etc.) You must take care that both radios are really same: both have
extended range or not, both are E-version or not etc.
It will cause some problems if you try to clone i.e. an E version
without expansion into a A- or J version.
If you have both radios please hold down the -0- key / PAG L Key when
you switch on the radio. So you see the letters CLONE on the display.
Please push the ptt on the radio which has to be the master.
It takes a time to transmit all memory with maybe names, call sign etc.
After Clone is finished you see END written in Display. Best is to switch

of both radios. After switching on again you will have two same radios !

EXTENDED RX/TX
==========
Thats all...Don't cut the green wire, or install any jumpers as before.
This mod is the official one from Kenwood, taken from a data sheet put out by them.
1. Open the unit by removing three screws from the back and one under the DC power input cover. Carefully separate the front and back pieces.
The two case halves may be disconnected by pulling the wired plug and by prying the brown latch on the ribbon cable connector up enough to release it.
2. On the front PC board in the lower right corner as viewed from the rear with the knobs pointing up there are seven spots for diodes in a row, with one diode missing.

```
| o o o o x o o |
_________________|
2 3 4 5 6 7 8
```

The numbers are D302-D308, left to right, with D306 missing.
3. Remove diodes D304 and D307.
Now you must have this:

```
| o o x o x x o |
_________________|
2 3 4 5 6 7 8
```

5. Reassemble and apply power. Mod complete.
Now the ranges:
67-174.995 and 400-511.995 RX
136-174.995 and 400-511.995 TX.

PS: Just cutting the green wire by the recharging jack is the MARS mod.. Don't cut if you intend to do the above mod..

Discription of the diodes:
==========
In my HT diode D303 are not installed, green wire cut. RX as wide as possible (69-179Mhz) and TX from about 130 to 179 MHZ. No crossband repeater.
Now I tried to modify the handy, but i was not carefuly.
I removed D305 and the Bander goes in the Lock-key modus:
All keys are locked in cases of the Lock-switch.
QRG disapeared and the channel nummbers shine on the display.
Then I put D307 to the place I removed D305:
Now I had the TH79A version with no light, but a call channel installed.
All functions are the same as before, but TX was only possible on the amateur radio bands. Automatic shift keying as discriped in the manual for the american version. (Not to usefull in Europe :-), but you can change the QRG's now....)
Not the situation on the TH79A I wand, I remount diode D306 to the location of diode D307 to change to TH79E back. And now the work was finished:
Transmitting as descriped above, no lock function activ, crossband repeater enabled. THE MENU-SETTING 18 are activ: "Answer back function" for the paging mode: transmitts an code back to show that the call received.

But the continues TRX showing up later in this doc has not been verifyed.
The purpose of diode D302 was not to be able to find out because the first
diode I wand to unmount had been damaged ;-(

Here is the MARS/CAP modification
==========
1. Remove battery.
2. Open case by first removing 3 screws (#00 Phillips) on back and 1 screw
on side hidden underneath the rubber flap covering the DC power jack.
Gently pry apart starting at top; BNC connector will move with back,
knobs with front.
3. Spread unit out. Wires will "hinge" on the side with the PTT button.
4. Looking on the back of the keypad (front) half, locate green wire on
upper left, just below the CTCSS decoder module.
5. Neatly cut this green wire, and tuck back in so ends won't touch each
other or other components.
6. Reassemble.
Programmed memory will be lost since the CPU will notice the strap change
and reset itself.

Before: VHF RX - 118.000-173.995 TX - 144.000-147.995
UHF RX - 438.000-449.995 TX - 438.000-449.995
After: VHF RX - 118.000-173.995 TX - 142.000-151.995
UHF RX - 420.000-449.995 TX - 420.000-449.995

If I read the schematic right, the green wire corresponds to "W301", which
also serves the same purpose as removing "D308". More research needs to be
done on other mods; I'm especially interested in extending UHF receive beyond
450. There is a row of diodes right below the uC which appear to be D302

Remote Base Operation with Kenwood 732/733
==========
Kenwood has now simplified remote base operation of their mobile rigs
with the TH79.

I will not give a step by step on how to control the mobile rigs, since
they are different. Hoewever, to really understand this feature, I would
first get to know the remote control feature on the mobile very well. This
makes the following explanation a little clearer!

To access this feature, hold [PTT] and [MR] while [POWER ON].

The display will indicate -RC-, which I presume means 'Remote Control'.

If you have correctly matched your DTSS codes, frequencies, etc, the
dual bander's keypad now becomes a function pad. Pressing certain keys
enables or disables functions on the mobile rig by sending the DTMF
sequences for you.

Please note that all this fuction does is send the DTMF tones over the air
to control your mobile rig. I have not made a list of what each key does,
but as the 79 sends the DTMF tones, the display will indicate the function.
(i.e. - RPT ON, RPT OFF, TONE ON, TONE OFF, etc.)

"The "RC" function is configured to directly control radios such as
the TM-732. In fact, if you look at the layout of the microphone remote
commands for the 732 it very closely matches the key assignments for of
the "RC" mode. Since I have a TM-732 installed in my car, I had a chance
to try this out and it's VERY convenient. Everything from direct frequency
entry with the "F" key to enabling X-Band repeat. I'm really surprised
they aren't marketing this feature of the radio."

Measured specifictions of TH79
==============================

Band - VHF --
Frequency Sens (uV) Power Mode
--------- --------- ----- ----
108 4 - A3
110 2 - "
115 .75 - "
120 .40 - "
125 .30 - "
130 .30 - "
135 .30 - "
140 .12 2.9 F3
145 .12 2.9 "
150 .13 2.8 "
155 .15 2.4 "
160 .18 1.9 "
165 .20 1.45 "
170 .21 1.10 "
175 .30 0.85 "
179.995 .35 0.70 "

Band - VHF (2) (set to 300Mhz) --------------------------------
Frequency Sens (uV) Power Mode
--------- --------- ----- ----
300 50/75 - A3/F3
320 4/20 - "
340 .3/.6 - "
360 .2/.5 - "
380 .2/.6 - "
400 .2/.75 - "

Band - UHF --
Frequency Sens (uV) Power Mode
--------- --------- ----- ----
400 11 1.0 F3
410 4 1.5 "
420 1 1.85 "
430 .2 2.2 "
435 .12 2.3 "
440 .10 2.5 "
445 .10 2.5 "
450 .10 2.5 "

455 .15 2.3 "
460 .16 2.3 "
465 .20 2.0 "
470 .45 1.8 "
480 1 1.6 "
490 2 1.3 "
500 6 1.1 "
510 no RX over 509 0.8 "

BTW, close inspection of the RF deck in my radio shows no obvious
missing parts. I didn't remove the board to check the other side, but
my suspicion is that the 800 MHz parts are installed. I'd be interested
in input from others on that. So far I've not discovered how to make it
display any 800 MHz frequencies though."

CONTINOUS TRX
=============
Pressing the VFO-key and the PTT key after a short beep and waiting a few
seconds with these two keys pressed will bring the th-79e into continous
transmit mode for about 10 minutes until TOT ends.
This will also work with the MR key.

end of the hidden functions

4718. FT-680R, mod to adjust duplex split

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-04 12:06:39 UTC
From: fdugas@halcyon.com
Message-ID: <fdugas.37.000C1C65@halcyon.com>
Source record: 223779

I am looking for a modifcation for the FT-680R that will bring the duplexe
offset from 1meg to 1.7meg. I contacted Yaesu and the problem I have is that
the shift is built into the processor of the radio. does anyone have any ideas?

4719. wanted for trade: SSB/fm 2m Moble

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-04 12:57:20 UTC
From: kedz@banach.WPI.EDU
Message-ID: <36rjfh$n5g@bigboote.WPI.EDU>
Source record: 223889

Looking for a 'newish' (1983 and up) ssb/fm 2m moble unit w/ approx 25W output.

Nothing in particular, although a few memories and pll on fm is very desireable.

I have an IC02at handheld (2m) w/ 5W battery and charger, lether 'twist' case and speaker mik, all in good condidtion.

A clegg fm 28 synthesized 25W 2m fm moble (great packet rig) with tnc cable.

Pk88 tnc w/ manual and cable for above (2).

All come with manuals.

I also have some misc test equiptment if interested.

I'll trade all or some depending on what you have and what your interested in, plus a few bucks if necessary.

please reply by e-mail.

Thaxs~

4720. Alinco DJ580T AM Aircraft band sensitivity

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-04 13:17:40 UTC
From: kevin.jessup@mail.mei.com
Message-ID: <kevin.jessup.8.000770FF@mail.mei.com>
Source record: 223894

I have an Alinco DJ580T dual-band (2m/70cm) HT. A fine HT that has given me excellent results on both bands.

AM aircraft band (after performing the mod) sensitivity has always been poor. Barely breaks squelch even when at the airport! The S-meter doesn't get off of the first segment. The AM audio sounds weak and noisy.

It's not the antenna as the Alinco antenna does fine on a different AM capable rig. Alinco tech support wants me to send it in (at what cost?) but I hate to part with it. Anyone else have a similar problem?

>(When mine puts out max, total plate curent is around 1000mA and plate
>voltage is just above 2000V).

>My qustion is what is the maxmum power you can get from Aplha ?

Several people responded this posting.
Yes, they said Alpha 76 can have more than 1500W.
I'd like to know what are the plate current/voltage, grid current, out
put power when it puts out max power.

One guy told me that there is a input power limit circuit which prevents
the more than 1300W in the newer model of alpha (> 1979).
I looked at my circuit, there is a circuit (does not show anything other than
a block) between the input from the driver and 0.02u, then it goes to the
cathode. I suspect this block is a input power limit circuit.
Could anybody give some idea about this block ?
Thanks

4723. Yaesu FT757 GX problem

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-04 15:50:06 UTC
From: dgontz@po-box.esu.edu
Message-ID: <36rtje$t6a@jake.esu.edu>
Source record: 223891

I'm posting this for a friend since he hasn't got Internet access.

==========

I have a Yaesu 757 GX. Within the last few weeks the receiver has started to malfunction. While in receive mode the rig will suddenly begin to sound as though there is an intense amount of static. Eventually the noise covers up any signals less than S9. I've found that giving the rig a wham on both sides or the top seems to fix the problem temporarily. Obviously this isn't the desired remedy though.

Someone mentioned that they had read something about a block of pin diodes going bad in the 757 causing this type of problem. Does anyone have informatin regarding this and what steps are necessary to correct the problem? Does anyone have any suggestions at all short of sending the rig back to the factory?

Thanks for any and all advice. / de Dave -- n3jfm

==========

Doug here again. Please send responses directly to me as it may be several days or even weeks before I get to read this list again. I'll just print the responses and pass them on to my friend. Thanks in advance.

Paul Christofanelli (paulc@fc.hp.com) wrote:
: The DTMF squelch problem is a known bug. Mine does the same thing
: (bought January 1993).

Good! Well not so good, but at least I know it's not defective then.

: I don't know how old yours is; perhaps they've
: fixed this in later models.

It's brand spanky new (Serial is 4C260835). Had the new green wire
so its at least in a fairly recent lot.

Interestingly enough, I contacted Yaesu about it at their service
department in SoCal. The message they left on my answering machine
in response said it had a SW malfunction and gave instructions on
how to send it to them for a repair. Now why would they have a
repair fix for it and not apply the fix to new manufactured units
I wonder?

Since it appears to be a class problem and not a defect in my radio,
it isn't serious enough to get me to pay to send the radio all the
way to SoCal and not have it for a week.

: -Paul C. KG0CZ

Thanks for the response......73s Brian

I have tried to send mail to the boatanchor mail list, without any success. The address I have used is owner-boatanchor@gnu.ai.mit.edu. I have been ftp'ing this list for a while, as the maintainer is not presently active. Is it possible for a non-subsriber to mail to this list and have it appear?

The information I am looking for is technical specifications for Hammarlund receivers models HQ-100, HQ-129, HQ-150, HQ-180. I need to know how their designs compare with sets such as the Hallicrafters SX-28 and SX-42 or National HRO.

Let's see.....I think the 76 has a bunch of resistors across the input in
parallel. The amp is grid driven, and the resistors provide the match for
the exciter. There is an (unofficial?) mod where you remove some of the
resistors to reduce the drive requirements on the exciter, but not so many
that you cause SWR power reduction in your solid state rig. I think that's
all there is to it.

: >an inexpencive GMARS unit. (You can monitor GMARS with a HAM no problem
: > most units have good enough sencitivity- antenna is no problem for
: >reception).

: Are you talking about the GMRS Radio Service? And are you stating that my
: Icom U-16 cost less than, say, a Yaseu FT-530?

: Buying an inexpensive GMRS unit (like the Uniden GMR100 or the Radio
: Shack unit) is a worthless purchase - IF you ever intend to access
: repeaters that offer public assistance. You need CTCSS and at least
: a watt to hit our system in SoCalifirnia - the Repeater User's Group -
: on 462.675 with a CTCSS tone.

: ---
The GMARS units units that I have seen operate simplex, and do not have
splits for repeater opperation. As far as I know the FCC has not allowed
non type accepted radios on the Gmars service. Most of the GMARS units
I have seen are a watt or 2. I do not know how common the practice is of
opperating HAM units transmitting outside of band but they are not
guarenteed by the manufacturers to operate withen specifications outside
of the HAM bands. The type accepted units are. If you are serious
enough to be using a repeater in tight spacing with alot of public
agencies I would think that you strongly consider using leagal equipment.

Message-ID: <36sif9$dgp@umcc.umcc.umich.edu>
Source record: 223751

Optoelectronics Freq Counter model UTC-3000, with option package
BLB-30.

This handheld frequency counter covers 10Hz-3GHz, has a built-in
16-segment RF signal strength indicator, and in addition to displaying
direct & prescale frequency, will show signal period, ratio, time interval,
and average.

The optional BLB-30 package are internal options which provide for a
backlit LCD display, and also a 'beep' function which causes the UTC-3000 to
respond with a beep when it detects a signal.

The unit is in excellent condition, and comes with all packing
materials (original box & manual), leatherette case, ac adaptor, antenna,
and original purchase receipt.

$200

If interested, send e-mail.

I am looking into getting a Kenwood TM-733A before the end of this year. I would like to know (since it's a new rig) if anyone has anything good or bad to say about it. Packet performance and compatibility is also a factor here as I wish to use it for 9600 baud operations in the 440 band. Thanks alot! p.s. Could you please e-mail any responses directly to my address? Thanks.

>noisy.

My DR-600T is also very poor in the sensitivity department, both on the aircraft band and as a policy scanner (460 Mhz). Signals that come in full strength on my Icom HT just barely break the squelch. Weak and noisy also applies.

I am very satisfied with the rig as a 2m/70cm radio, although I haven't had the time to play with the feature that I bought it for: dual-band repeat.

: is a difference in the sideband used for receiving 144-146 and 146-148. Why
: is this done, and is it critical? Thanks.

Since this is an FM rig the sideband referance does not make any sense.
Could you be refering to the TX Offset used for repeater operation ?

: Does anyone know what the difference between the 144-146 version and
: the 146-148 version is? Other than the difference in the sideband used?
: Thanks.

The only differances I know of are the 144-146/ 146-148 versions of the
radios. 142-146 are European, 146-148 are US rigs.

4736. FT5100 vs DR600T vs C5718DA?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-05 01:11:40 UTC

Message-ID: <philkeys-0410941711400001@ptpm011.olympus.net>
Source record: 223758

I'm trying to decide what dual-band mobile to buy and would appreciate any
comments and/or experience with:

Yaeseu FT5100

Alinco DR-600T - is remote DTMF control really useful?
- how well does detachable face plate mount somewhere else?
- can it run 9600 baud packet?

Standard C5718DA - how well does performing all operations from the
speaker/mic work? Can you do it while
driving?
- does it have any better intermod rejection or other
receiver operation?

Any other great dual-band mobiles for the price?

Thanks for any input.

:
:
\
The IF10B is a small circuit board with three chips on it - an 8250 UART, CD4020 counter/divider, and some kind of inverter/buffer package (I forget the part #). The kit also includes a new EPROM for the 940's main processor. The multitude of connections in a confined space would be difficult to deal with without Kenwood's pc board, and I don't know where you'd get the EPROM upgrade by itself, so you'd do best to hunt down the real thing.

On the other hand, the IF232 is just a vanilla TTL-to-RS232 level converter, with opto-isolators on all inputs and outputs. A MAX232 chip, four garden-variety LED-type optoisolators, and a handful of caps (about $15 worth of parts from Digi-Key) is all it takes to duplicate it. The circuit appeared in the February '93 issue of QST, including a source for pc boards (although the circuit is definitely simple enough to perf-board).

Hope this helps.

Phil,

I've had an FT5100 for about a year and been very satisfied with it.
It's extremely compact and a solid performer. No DTMF memories,
detachable panel or direct keypad input, but it does have cross-band
repeat, V+U/V+V/U+U monitoring, 47 frequency memories per band (arranged
as two banks of 23 plus a call channel), and is more reasonably priced than
the other radios you mentioned. All recent Yaesu mobiles (including the
5100) have a data in/out jack and are 9600 baud capable. Drop me a line
if you need any other specifics.

Hmmm. I had a DR600T once which had excellent AM and full UHF band sensitivity.

I sold the DR600T because it did not stay on frequency when in remote control mode. The UHF side would regularly jump to a seemingly random frequency while in remote control mode! I'd try accessing it (it was in my car) while in my office at work. No results. I'd walk out to the car only to discover the UHF side sitting near 470 MHZ (not anywhere near the amateur 70 cm band that was entered when I left the car) and happily crossbanding the 2-meter traffic onto 470 MHz!! Despite calls to Alinco and a detailed 3-page letter describing the problem, they denied it's existence!

Otherwise, the DR600T is a fine rig if you don't mind a front-panel that looks like it was designed by a committee. ;-]

All amateur SSB transmissions above 10 MHz use USB (upper sideband) by
convention.

However, the Icom IC-22A is an FM-only transceiver, so SSB reception ain't
possible anyway.

>Jeff

Jeff,

I had one of those. The receiver side is a converter, BUT the transmit side is a tripler/varactor.
Some 450 channels are not possible to get with this scheme with 5-khz increments on the 2 meter side.
CAn't help w/schematic, got rid of mine about ten years ago. Felt a need to cautiuon you about the transmit side.
Spectrally it wasn't too clean, either.

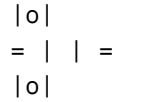
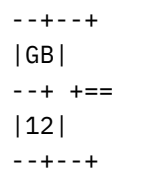
I purchased a couple "black boxes" at a recent hamfest and am trying to
figure out what they are. They are built using surface mount devices
and I don't recognize the part numbers. Can anyone help me identify the
following components?

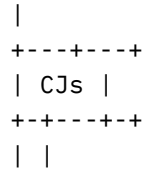
NEC part 8002 - appears to be 3 terminal white ceramic device as follows:



??? part GB 12 - appears to be a 4 terminal black plastic case:

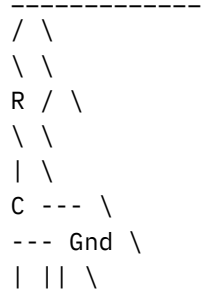


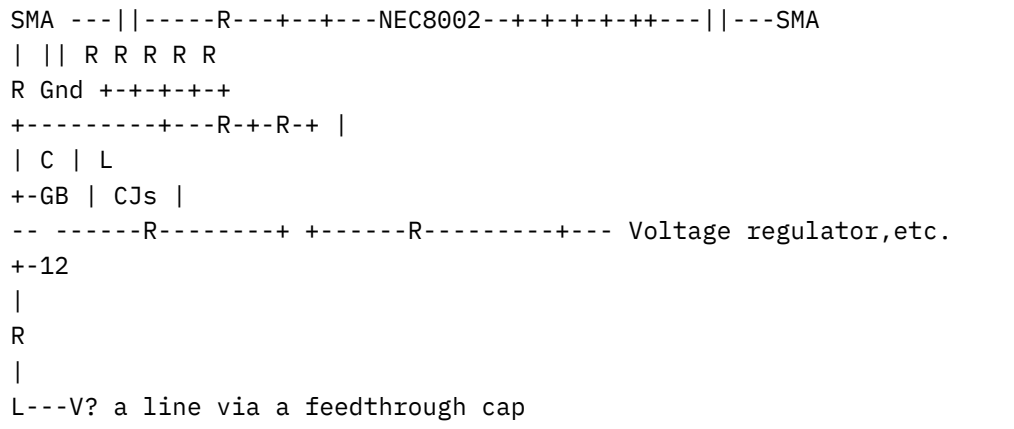
??? part CJs81?? - appears to be a tiny 3 terminal black plastic case
and I'm not certain about the 81, it's written at a
90 degree angle to the CJs and is microscopic in size:



Also, how does one tell chip resistors from chip capacitors? I'm new to
surface mount technology.

My guess is the device is some sort of uhf/microwave amplifier given that
it has an SMA connector on each end and what appear to be two supply
voltages, Vcc and bias? From the SMAs there are coupling capacitors
leading to the NEC device with an apparent feedback loop. So it looks a little
like (if I got the resistors and caps right):





Why all the resistors in parallel? Current handling?

Any guesses or information would be greatly appreciated before I try
and fire these suckers up and sweep them.

73,
Todd

I happened upon the middle of this thread, so my appologies if I got it all wrong. It seems that someone is anxious to get his boots up from 1300 watts to say 1500 watts but is kept from doing it by fuses blowing and other signs of stress.

Might I mention that achieving this increase, say by using a large nail in place of the fuse, will bring the linear's owner a magnificent gain of 0.6dB, say about one tenth of an S point.

I say: Leave the poor thing alone!

Greetings all,

Recently I decided to blow the dust off the Uniden 2510 10m rig. I remembered reading about a modification to boost the output power close to 100 watts. I found a copy of the article in the local library, and I'm ready to pursue getting the necessary components. Before I started however, I thought I would ask the collective wisdom of the net, if anybody has already tried this mod and has experience with it. The mod consists of adding a new final and driver transister, along with adjusting bias, and tweaking AM/FM and CW carrier levels.

So, anybody have thoughts they want to share about this mod? Anybody got a service manual they want to copy/sell/loan?

Thanks in advance.

: |o|
: = | | =
: |o|

This is a +28 dBm medium power C band GaAs FET.

To operate this, you will need a negative bias supply and a
drain supply that is either current limited or sequenced to
the negative supply. Shorting out the gate supply should
disable the drain supply--otherwise the FET may be fried.

I'd bias the device with 0.3 amps at 9 volts. The gate ought to
handle -10 volts. If I had the test equipment, I'd sweep it between
3 and 10 GHz.

4759. Wanted: Kenwood TS-50 Schematic

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-05 21:25:25 UTC
From: toma@xetron.com
Message-ID: <Cx7y6D.F0@xetron.com>
Source record: 223781

Yes, I am too cheap to buy the service manual for the TS-50. The "manual" that comes with the radio has no schematic or even block diagram in it. If some kind ham who has the service manual would copy the schematic (and block diagram) I would be glad to re-imburse you for copies and postage. I am interested in how the filtering works on AM (to possibly widen the AM RX bandwidth).

TNX, Tom NU8D

4760. Yaesu FT-411 HT for sale

Newsgroup: rec.radio.amateur.equipment

FOR SALE (in the U.S.A. only):

YAESU FT-811 70cm (440MHz) HT
like new condition, includes:

- optional CTCSS tone encode/decode installed
- FNB-10 7.2v 600mAh NiCad battery pack
- NC28B charger for FNB-10
- FBA-17 battery case (holds six standard 'AA' cells)
- MH-18A2B clip on mini external speaker/mic
- original Yaesu antenna *AND*
special Motorola hi-gain antenna
- manual & quick reference (clean condition)
- original box

- support for VOX
- 48+ memory
- additional DTMF memories for autopatch
- tested by Motorola engineers, and this unit
exceeds Yaesu's printed performance specs.

Asking $225 plus shipping - will also toss in a FNB-12
(12v 500mAh NiCad) battery.

...
When I read this I looked very carefully at my HTX-404, which has always had a problem with the battery pack being slightly wobbly. I am pretty sure plastic is not broken, nor is there anything wrong with the battery pack. (I also have an HTX-202 and an extra battery pack, and all the packs work fine on the 202 and are loose on the 404. I've looked very hard at both rigs and can't see any difference.)
Does anyone have any ideas on this? I suppose it is a manufacturing tolerance problem. The only effect it has is that if I am scanning and jar the radio a little bit it stops scanning and stays on whatever frequency it was listening to when the loss of contact occurred. I suppose I should take it back for a warranty fix, but I hate to lose the use of it for several weeks.

>Newsgroups: rec.radio.amateur.equipment

B>: I picked up a BP-8 8v high capacity battery and a BC-35 Drop-In
>: Quick Charger for the unit at a swapfest. But, guess what? The
>: BP-8 hates the HTX-202, or the other way around.

Most HTX-202s will not take a BP-7 Icom pack. The BP-8 usually
works well. If the Zener diode in the bottom-feed circuit is bad,
only a 9.6-vdc pack or less will work. A minor headache at the
very least.

ALWAYS: Slide off your NiCad pack when using external DC power from
your vehicle or a power supply! Leaving the pack on while mobile puts
too much burden on the Zener diodes, and generates heat at twice the
normal rate. Save your radio and take off the pack!

Unlike it's Icom brother, the 202 will not top charge an Icom pack
while on external DC power. Refer to the warning above!

WARNING: DO NOT ATTEMPT TO BOTTOM-CHARGE THE STOCK NICAD PACK IN AN
ICOM BC-35 OR CLONE CHARGER.

DESIGN FLAW: Some early production (S/N 2500 and down) radios had
the NiCad Zener Diode located too close to the finals, causing
final transistor failure when used on external DC with the pack in
place. This was remedied in production, and Tandy will remedy
under warranty.

The Yaesu YH-2 is simply a boom-mounted microphone and an small speaker, each running to their appropriate plugs; nothing more. There are no switches connected inline.

>Is he/she using an earphone too? I'm pretty sure vox won't work without also
>plugging in an external speaker (the intent being to avoid feedback).

Does the throat mike have an earpiece accompany it? Perhap, as Tracy suggests, the 530 needs a connection in the earphone socket when in VOX mode.

Something to experiment with when I get home. Will post the results.

kevin.jessup@mail.mei.com (Kevin Jessup) writes:

>
Hmmm. I had a DR600T once which had excellent AM and full UHF band
sensitivity.

I sold the DR600T because it did not stay on frequency when in remote
control
mode. The UHF side would regularly jump to a seemingly random frequency
while in remote control mode! I'd try accessing it (it was in my car)
while
in my office at work. No results. I'd walk out to the car only to
discover
the UHF side sitting near 470 MHZ (not anywhere near the amateur 70 cm
band
that was entered when I left the car) and happily crossbanding the 2-meter
traffic onto 470 MHz!! Despite calls to Alinco and a detailed 3-page
letter
describing the problem, they denied it's existence!

Otherwise, the DR600T is a fine rig if you don't mind a front-panel that
looks like it was designed by a committee. ;-]

^^

My DR600T was also very sensitive and I also have problems with remote
control. It seem that some voice components and courtesy tones mimic DTMF
and cause the DR600T to interpret them as commands. Otherwise, I love mine
also.

4767. Icom R71/IC-751/IC-745 memory fix

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-06 04:42:06 UTC
From: willco788@aol.com
Message-ID: <36vv6u$qr3@newsbf01.news.aol.com>
Source record: 223792

THIS INFORMATION WILL COMPLIMENT THE PRODUCT REVIEW THAT WAS
PRESENTED IN THE JULY 94 ISSUE OF QST

THE WILLCO ELECTRONICS ICM-1024 ("NO FAIL" MEMORY FOR ICOM RADIOS)
CONTAINS A READ ONLY MEMORY THAT STORES THE RADIO'S IMPORTANT DATA.
WHEN THE BACKUP BATTERY DIES, THE RADIO WON'T FAIL!

MORE MEMORIES THAN YOU'LL EVER NEED!

USING A 32k RAM THE ICM-1024 INCREASES THE MEMORY SIZE 32 TIMES
PROVIDING UP TO 1024 LOCATIONS (INCLUDING THE IC-745) FOR FREQUENCY
AND MODE TO HELP YOU MANAGE YOUR FREQUENCIES, WILLCO ELECTRONICS
PROVIDES A MEMORY LOG SHEET AND UTILITY WORLD'S HOT 250 H.F.
FREQUENCIES ARE PRE LOADED ("UTILITY WORLD" IS EDITED BY LARRY
VAN HORN AND PUBLISHED BY MONITORING TIMES MAGAZINE).

EASY TO INSTALL

THE ICM1024 IS EASY TO INSTALL AND IT CAN BE USED AS A 32 CHANNEL
DIRECT REPLACEMENT FOR ICOM'S EX-314 RAM UNIT.

WHEN INSTALLED IN THE R71 or IC-751, THE 32 BANKS CAN BE ACCESSED
DIRECTLY FROM THE RADIO'S FRONT PANEL WITHOUT ADDING PUSH BUTTONS
OR SWITCHES. THE HEART OF THE ICM1024 IS A CUSTOM INTEGRATED CIRCUIT
THAT HANDLES DATA AND BANK SWITCHING. (THE IC-745 REQUIRES EXTERNAL
SWITCHES.)

HERE'S HOW IT WORKS

BY CONNECTING THE ICM1024 RIBBON CABLE TO THE R71 MATRIX BOARD, THE
MEMORY NUMBER (THAT'S DISPLAYED ON THE RADIOS FRONT PANEL) CAN BE USED
TO CHANGE THE BANK NUMBER.

WITH OR WITHOUT THE IC-EX310 SPEECH MODULE , THE SPEECH BUTTON ON
YOUR R71 WILL SERVE AS A BANK=MEMORY SWITCH. TO RAPIDLY CHANGE BANKS,
SIMPLY ROTATE THE MEMORY KNOB AND SELECT A MEMORY. THEN PRESS THE
SPEECH BUTTON AND THE BANK, (THAT CORRESPONDS TO THE MEMORY NUMBER)
WILL BE SELECTED.

EACH TIME YOU PRESS THE SPEECH BUTTON ON THE IC-751, YOU STEP TO THE
NEXT BANK. THE FUNCTION BUTTON REVERSES THE STEP DIRECTION AND THE
XIT/RIT RESET BUTTON JUMPS YOU BACK TO BANK 1. THE IC-745 REQUIRES
3 EXTERNAL SWITCHS.

BY PLACING A FREQUENCY (THAT CORRESPONDS TO A BANK) IN A MEMORY
LOCATION, YOU CAN DETERMINE THE BANK NUMBER. FOR EXAMPLE, 2.2 MHz
IN MEMORY 32 CAN INDICATE THAT BANK 22 WAS SELECTED.

EXTENDED FREQUENCIES

THE RECEIVE FREQUENCY LIMITS ROM WHERE MODIFIED AND NOW THE RADIO CAN TUNE FROM 10KHz TO 31 MHz. (MODELS IC-751, IC-751A, IC745 AND R71). HERE IN THE MIDWEST, FOR EXAMPLE, I CAN COPY RTTY ON 48 kHz, THE S.L.F.C.S. (Survivable Low Frequency Communications System) TRANSMITTING FROM SILVER CREEK NEBRASKA IN THE CLEAR!

CONTACT; WILLCO ELECTRONICS, P.O. BOX 788, NEW LENOX, IL 60451.

I talked to my friend with his problem, and the throat mic he is using does
have seperate earpiece and mic. There are two connectors that go into the
FT530, I suppose one for the mic (and PTT?) and one for the earpiece. There
is also a small 'pod' with the PTT switch. He tried turning on the VOX and
leaving the PTT switch pressed, but the 530 simply continued to TX.

It sure would be nice to figure this thing out. I doubt if the Yeasu set has
any electronics in it, but it may.

Thanks for the info,
Tracy

4777. Vertical HF Antennas

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-06 16:56:21 UTC
From: ianheng@merlion.singnet.com.sg
Message-ID: <371a7l$mhr@merlion.singnet.com.sg>
Source record: 223679

Hi there,
I have been using a Hy-gain 14AVQ HF vertical antenna for 6 years.
It has served me very well though its 1/4 wave and need lots of radials.
It is my first HF antenna and I thought of donating it to a new ham,
since I now have a little more savings to buy a new and hopefully more
high-tech vertical antenna.
Does anyone have a good recommendation ? I will certainly appreciate a
short write-up of your experience.
Somehow, I still feel that the best antennas are made in USA.

Thank you for your attention.

Best regards,
Ian Heng (9V1XA@amsat.org)

>to say 1500 watts but is kept from doing it by fuses blowing and other
>signs of stress.

>Might I mention that achieving this increase, say by using a large nail
>in place of the fuse, will bring the linear's owner a magnificent gain of
>0.6dB, say about one tenth of an S point.

>I say: Leave the poor thing alone!

An unrelated, but interesting question, is where should the 1500 watts be measured ? At the output of the amplifier, or at the antenna feedpoint ? As pointed out in Dave Leeson's (W6QHS) book, "Physical Design of Yagi Antennas", the FCC rules are not clear on this point. This is not a moot point for those of us who might have 3 dB of feedline loss on 10 meters.

I can see the flames flying already !

4786. HTX-202 powersave mode strangeness?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-06 19:00:15 UTC
From: tom@kontron.de
Message-ID: <371hg0$oo6@Kontron.De>
Source record: 223719

Hello!

Anyone out there with an HTX-202 experiencing the following when
placing their HT in powersave mode?

Set the powersave mode to 1 - 2 from the default (1 -16) in
the setup menu. Then tune to an unused frequency, set the
squelsh tight, and enable powersave mode.

Wait several seconds, and now try to use the tuning knob
to change frequency or memory channel.

You can't! (or at least, I can't.) I am only able to change
frequency using the up/down buttons on the keypad. If the
squelsh is opened by a signal or pressing the monitor button
the VFO knob functions for several seconds after no singal
is heard and then knob locks up again...

Interesting is that the HTX-404 doesn't exhibit this
behaviour.

By the way, anyone know where the FM deviation adjustment is
in the HTX-202 or HTX-404?

Otherwise, been very happy with both HT's. Too bad though they didn't
implement
1750Hz tone burst as well as CTCSS though. Nothing that a DM69,- tone burst
mike can't handle though...

I've noticed this same problem and thought it was just me. I also have
the 202 and 404 and the battery is also slightly loose on the 404. I've
switched packs and all is fine on the 202 and still a little loose on the
404. Perhaps this is the norm.

Regards

Ken

I am actually in the same situation. I am looking at ICOM W21AT which has a nice telephone style mechanism to allow you to talk without using the PTT. The Yaesu FT530 is a nice unit with VOX and has an optional wireless mic which displays the frequency number. The Kenwood TH 78A/79A has alphanumeric display which is nice for keeping track of different repeater names. The prices for these three models are similar.

I have a VoCom 2 meter amp (gold tone, aluminum case,
LED power light) that I'm looking to sell to a fellow netter.

Problem is that neither of us REALLY knows what it's worth.
2 watts in, 25 out, FM only, works beautifully. About
3 x 3 x 1" high, with a simple paddle switch for on/off.

Any help out there?

Thanks, much appreciated,

>Does anyone know what the Yaesu mic schematic is, or why it works on VOX and
: > >>other mic's dont?

: I talked to my friend with his problem, and the throat mic he is using does
: have seperate earpiece and mic. There are two connectors that go into the
: FT530, I suppose one for the mic (and PTT?) and one for the earpiece. There
: is also a small 'pod' with the PTT switch. He tried turning on the VOX and
: leaving the PTT switch pressed, but the 530 simply continued to TX.

: It sure would be nice to figure this thing out. I doubt if the Yeasu set has
: any electronics in it, but it may.

: Thanks for the info,
: Tracy
:

I talked to the Yeasu guys about this. The Yeasu boom mike has no
electronics. The radio senses the audio from the mike. They said the throat
mike might be made to work by not using the push to talk portion of the
throat mike. The throat mike assembly is already set up with a plug in line
to the switch assembly. A adapter would need to be made to go from the 1/8"
stereo type jack to the 2 jacks to match the radio.
I suppose you could operate on the push to talk assembly, wiring the mike on
at all times. It must be going through the PTT switch now or you would think
it would work without tinkering. If this is the case, the PTT must be a 2
section switch, connecting the mike audio and providing the connection for
the resistor circuit which actuates the radio logic.
I don't see why it is neccessary for the mike audio to be interrupted. With
the Yeasu vox boom mike rig, you can turn vox off and use the radio PTT and
that works fine.

Maybe your friend should just make the audio connection through the throat
mike PTT assembly direct and try that out.

Please let me know how this works out. I'd like to use one of those mikes on
my motorcycle.

Have a 202 that got dropped, and made the pack wobbly. I very carefully bent
the metal part back into shape to remove the wobble. Before that, I had strange power
failures. The metal parts do seem to be critical to fit as well.

Can only answer part of your question: Why all the resistors in parallel? Since parts have become so cheap and labor so expensive, manufacturers have found it more expedient to parallel or series components to create the value desired rather than spend the effort to stock many different part numbers. Two 10Ks = either a 5K or a 20K with no extra documentation at all. Make it three or four or more and the savings get even larger. Granted, the purists will complain about reliability when using more parts, but the reliability of components run at low power these days is so much better than the old days that it doesn't really matter.

Hope this helps.

John,
I understand from reading the CIS:HAMNET thread on Compuserv (far and away better than the usenet groups on Internet; Why is that ??), The Index Labs QRP rig is superior, for about $600. They advertise, I think, in QST. If you can't find the phone#, E-Mail me, or maybe someone else can follow with their experiences. All the postings by those in the know indicate it's a better rig for the money, although lately there have been complaints about long wait times.

Message-ID: <43668.hberg@sun.sws.uiuc.edu>
Source record: 223735

I'm having an intermittent problem with the display on my Yaesu Ft-2200 radio. Occasionally, when I turn on the radio, all the LCD segments are lit, or some miscellaneous ones are lit - the display looks "scrambled". The radio continues to function normally - I can transmit and receive on the frequency that is set. I sometimes can return the display to normal by pressing the F/W key, and sometimes by turning the radio on and off.

Has anyone else seen this problem?

Hello Friend Hams.....

I have just purchased a HAL CRI-200 Computer RTTY Interface and am
looking to find some information on same.

1. Does anyone have a manual that I could get a xerox of?

2. What is the power voltage and polarity required at the dc power
adapter socket on the back panel (+12vdc? GND=SHELL?).

3. What is the pinout and interface specifications on the 5 pin
computer I/O port connector? I am assuming RS-232, but it could
be something funky like 5V tty RS-232, or it might even be current
loop (20 ma).

4. What are the cw keying polarities on the two keying jacks?
Any Help is appreciated

Most Sincerely,
Robert D. Keys, ``Boatanchor Bob'', NA4G

Reply-To: hadleyv@bones.et.byu.edu
Distribution:
Summary:
Keywords:

Looking for a good used Function Generator.

-Sine Wave
-Square Wave
-Triangle Wave
-Variable Duty Cycle
-Sync output
-Frequency can be controlled by an external DC voltage
-50 Ohm output Impeadance
-Variable amplitude (>10Vp-p into a 50 ohm load would be nice)
(range of at least <20mVp-p to >20Vp-p (open circuit)
-Has variable adjustable DC offset voltage
-A Sweep ability would be nice but is optional
-A freq range of at least .2 to 2MHz but would like up to 10MHz if
not too expensive.
-A manual if possible.

This is for personal use at home while attending school, etc.

Thanks!

Rob> anybody could tell me about their experiences with this unit,
Rob> good or bad. Is it capable of working with a 9600 baud TNC?
Rob> Does anybody know of any reviews of this radio? Any info
Rob> would be greatly appreciated...

I am also new to Ham, currently studying for the Technician test.
While I don't have much hands-on experience with HT's, I have done a
little research on the HTX-202 and recently bought one. QST magazine
reviewed several 2m HT's in October 1992, including the HTX-202.
Other radios reviewed were: Alinco DJ-162TD and DJ-F1T, ICOM IC-P2AT
and IC-2SRA, Kenwood TH-28A and TH-225A, Standard C168A, Yaesu FT-411E
and FT-415. Here's an excerpt regarding the HTX-202:

The runaway leader in in-band receiver performance, the HTX-202,
Radio Shack's first-ever 2-meter hand-held tranceiver, does the
company proud. This rig has taken a lot of pounding on the air and
in other ham forums for its lack of receiver coverage outside the 2m
ham band - something that every competing radio provides - but the
benefit is a direct payoff in adjacent-channel selectivity and
two-tone, third-order IMD dynamic range. [...] What does this mean
to you? The HTX-202 is practically immune to the interference
problems so common in urban areas thick with VHF radio traffic.

[...]

Other points in its favor include its ruggedness, super-easy
programming and operation; loud, low-distortion receiver audio; and
clear, well-illuminated display. It's the only radio in the group
that comes with both an alkaline battery case and a NiCd battery
pack. Its instruction manual is also excellent.

[...]

The HTX-202's unlit keypad can be hard to read in the dark, and this
is *not* a compact radio. [...] But therein lies the advantage:
Though Radio Shack's accessory offerings are few, the HTX-202 is
compatible with ICOM's large line of IC-2AT-series accessories.

For budget-conscious operators who value solid receiver performance
and the ability to buy locally, and who don't consider the HTX-202's
lack of extended receiver coverage a major liability, this radio
offers solid value and good basic performance.

[...]

Only the HTX-202 includes a battery-charging indicator. This
feature, insignificant as it may seem, made most of the evaluator's
wish lists.

[...]

For thos who need only ham-band coverage and 16 memories, Radio
Shack's $260 HTX-202, the second-least-expensive radio reviewed
here, is another super value. Its receiver performance, standard
extras, and high transmitter power (6 W at 13.8 V) make it best
suited for occasional portable or mobile use and the best of this
bunch for home-station operation.

Radio Shack had the HTX-202 on sale for $199 recently. I bought one
on the last day of the sale, but I think they're back at $259 now. At
that price, you might want to take a look at some of the other HT's on
the market...

You might also send mail to brettb@cruzio.com. He is organizing a
mailing list for the HTX-202 and might have some information for you.

Hope this helps you.

>I don't know if there's been much discussion of the TenTec Scout here, but I'
>m thinking about buying one and would appreciate any comments from hams
>using this rig.

Jon,

I hav bought one a few weeks ago, and although I had no chance to
compare it with other rigs, I can say the following:

1. Changing the modules is a bit tricky, so although they are cheap,
its not that you can freely flip across the bands. More for using
with a well designed monoband antenna.

2. Tuning it takes getting used to. When you touch the tuning knob
the frequency locked loop will unlock and then lock after leaving it.
so during tuning the pitch of a cw signal sounds rather wobbly.
(after locking it is rock steady of cause)

3. The rx is based on a 7dbm balanced mixer, from discrete components
(if I reember correctly), So although this is not the Ultimate,
it is OK.

4. The continuous bandwith filter tuning works well and without
ringing at cw. One thing I dislike there: I think that the skirt
steepness is not as high as it could be: When you tune across a strong
carrier, e.g. a am bc transmitter, you will notice it coming up
on the other sideband. I have no quantitave number as to the suppression,
but I get to measure it in a few weeks.

5. The absence of unneccesary knobs is a treat.

Well, this is all, remember that we are talking about one of the cheapest
rigs on the market. I should like to compare it with a TS50 on 40m...
Comment from another ham here: the best mobile/portable rig around.

vy interested in more infos myself, 73, Moritz DL5UH

4815. TEST EQUIPMENT- INDUCTANCE MEASURING

4816. Advice? - Hand held radios for ski team

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-07 20:16:37 UTC
From: alan@snowcrest.net
Message-ID: <alan-0710942316380001@ppp0.mtshasta.snowcrest.net>
Source record: 223611

Can you offer any suggestions or forward me to the right place?

I am looking for a source of used or less expensive radios to outfit our self- funded, small school, public H.S., ski racing team. I think I need something comparable to the following:

The Motorola P-50, 2 channel, 5 watt, with private line (not a digital private line). My common channel (channel 1) should be the frequency of 151.955 MHz and the private line will be something else. I want a speaker microphone ($54). I do not think that we need to purchase extra batteries.

I would like as many as four radios but could build up to that number one or two at a time.

Thank you for your help.

Alan

4817. TH-79A mods wanted!!!

Yes I have somthing to say, It doesnt work the way it should, in theory it should work but the rest of the components are not designed to handle the load of the high powered final & and driver. The best thing you could ever do with that radio is send it to chipswitch or get the kit from them and install it yourself
if you feel like you can. Their number is 707-539-0512. There is also a place in NY that will install the chip and modify all kinds of things in that radio. I have one and it is the best thing you could ever imagine for that radio. If I could find another HR-2510 for sale I would buy it and have the mod done so I could have one for the mobile and one for the base.....

Hello all,

Does anyone have information on a Motorola "Wombat" mobile radio?
I have one and would like to try to press it into amateur service.
It was apparently made in Australia in the late 70's or early 80's.
It comes in an aluminium clamshell, and has a microphone with
built-in controls (ch., scan, monitor, etc). I tried mine and
it transmits in the 450-470MHz range.
If anyone has the service manual and/or codeplug programming info,
please let me know.

I found that mine did that as well, but if I changed the delay time for the power save mode, it seemed to work okay without having to disable it completely. I cannot remember which setting it was at when I had the problem, but I think it was 1/2 second. Now I have it back to 1/16 where it was when shipped.

Just some input.

: Does anyone know where I can get plans to build a doppler.?

I assume you are talking about doppler type direction finding units. If so, try the article in 73 Magazine, June 1991, page 32. It's a construction article featuring the Doppler Systems unit. This is an early version, but an excellent version.

Also, check the book "Transmitter Hunting, Radio Direction Finding Simplified" by Joseph Moell, K0OV and Thomas Curlee, WB6UZZ, TAB Books, ISBN 0-8306-2701-4. Another doppler unit is described starting on page 123, the Roanoke Doppler DF. I think a kit version is available, but I don't remember where.

|>
|>I can see the flames flying already !

Flames, naw, only from the poor amp. This same question was brought up a
while on the contest reflector. An even stranger spin than taking into
account your feedline loss is why can't one run X over X over X with each
being driven at 1500 watts.

More flames a coming.

Source record: 223656

In article <Cx3xK5.EwE@chinet.chinet.com>, drx@chinet.chinet.com (Scott Whittle) writes:

>Anyone care to foward the info for programming the UHF Motorola MaxTrac
>radio? ANY help would be appreciated!!!
>thanks,
>s.

Motorola uses software to program all of their current lines of radios. Each model of radio usually requires a different program. In addition, a device called a Radio Interface Box, or RIB, and the correct adaptor cable for the radio being programmed are needed. Again, each model will (typically) take a different cable. The newer the radio, the greater the chance it will take a different cable than any other model.

The MaxTrac uses different versions of software depending on whether the radio is conventional or trunked. A conventional VHF will use the same software and cable as a conventional UHF, however.

The RIB and cables are available from Motorola or from outside vendors. Look in the back of Mobile Radio Technology or some similar publication. Cost will run $100 (aftermarket) - $250 (Motorola).

The software is a different story. It is only available from Motorola, and it is copyright software. Motorola has no sense of humor when it comes to bootleg or hacked programming software.
It can be ordered from National Parts Distribution. Expect the cost to be in the neighborhood of $250-300.

Programming the radio is fairly straightforward. Make sure you have the RIB connected, and make sure you have power to the radio. Programming is done on a mode(channel) by mode basis for freqs and PLs. Timeout is set radio-wide, and power and deviation settings are done in a different service mode using the same software and RIB.

Your best bet is going to be to find someone familiar with Motorola programming in your area. It may be more economical for you to pay a programming fee to have someone else program it for you rather than springing for the software and equipment yourself.

Hope I answered your questions. If you want, you can E-Mail me privately, and I will discuss in greater detail.

My sister has an ICOM 02AT which needs a replacement power transistor. I can get the transistor for under $5, while ICOM wants $50 to replace it.

My question is: should a person of average soldering skills attempt the replacement or should I just send the unit back to ICOM. In looking at the board, it seems doable - but then I think of the possibilty of heat damage to the other components. Any thoughts on the subject would be appreciated. E-mail is preferred, but post if you must..... Thanks,

I have seen both and played around with them. My personal pref would be more towards the 78A rather than the 79A. 78A can allow for more memories, up to 250 with expansion memory. It has memory scan lockout where the 79A doesn't. Audio output is a tad better also. I own a 78A and compared to 79A, I'll keep the 78A. I have also played with the 530. It does have an excellent tx audio. Best I've heard from an HT. But battery life and intermod, which Yaesu is known for, still exists.

I shopped for a few months before I bought the 78A. Have loved it ever since. Just be aware of the 79A, it's not all its racked up to be, just because it has FETS...

4844. Re: How About the Scout?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-08 21:05:16 UTC
From: morawski@starbase.starbase.mitre.org
Message-ID: <MORAWSKI.94Oct8170516@starbase.starbase.mitre.org>
Source record: 223659

Regarding the Scout:

1) I don't think of it as a QRP rig--with 50 watts out, it's a lightweight (as opposed to heavyweight) transceiver.
2) It has a few minor warts--potential to drift in certain circumstances, tiny bit of processor whine on audio.
3) The Jones filter is good, but not quite the same as a full-blown crystal filter.
4) The receiver is very sensitive.
5) The rig is EXTREMELY easy to use--appropriate for the new ham, or one who likes to get "back to basics."
6) It's a lot of fun! I got mine to take on vacation/camping trips (yet to happen), and I frequently turn off my Paragon at home and use the Scout on 40 meter CW and have a ball!

The Scout is not the ultimate rig, and if you want fancy (and harder to operate) get a TS-50. I like mine and plan to hold onto it for travel and as a backup HF transceiver.

Its supposed to be a nice rig provided you can buy it at a sensible price. It was reviewed in QST at the beginning of the year.

I personally don't like the idea of having optional modules. I have a feeling that if you don't get all the modules, you may later have problems getting them after production has ceased.

Here in the UK it is very poor value for money as it is so expensive. Added to that, the modules are more than double the US price.

You don't say which country you're in. In the UK, the basic unit would fetch UKP 120 second-hand. I guess in the US the price would be significantly lower.

Steve,
My name is Mike Bush and I am a radio technician at Communication Headquarters, Inc. in Wilmington, N.C.. I work on those radios daily. I have talked to the members of the yaesu service dept. and have found that there is not a correction yet available.

I have a correction that has not yet failed on over 20 rigs that I have applied it to. I have placed a small single strand of 26 or 28(maybe even 30) gauge wire behind the contacts in the connector on the display head. This provides pressure on the contacts ensuring good connections of the LCD driver(Including Grounds).

Let me know how it works out, or give me a call for further explaination of my procedures.
My work number is 1-910-791-8885.
We have a 1-800-688-0073, but that is our order line and it doesn't go in the back where the techs work.

4848. Need Info/Manual for Collins HF-8040

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-08 22:30:51 UTC
From: dts@world.std.com
Message-ID: <CxDL7F.6M1@world.std.com>
Source record: 223660

I am looking for a manual or any information on the Rockwell International/
Collins HF-8040 Antenna Coupler. This device is a remote control, high power
end fed wire tuner which was made for military use or some such.

Collins does have the manual available, for $100, but they could not tell
me if the manual included schematics, etc. The device contains a very large
motorized inductor (which has associated with it a few vacuum relays),
two motorized vacuum variable capacitors, a power supply, an SWR sensor
and a logic board.

It is possible that this device is an automatic tuner, or at least a completely
remote control tuner. A friend and I each bought one. The plan is to load a
long wire of some sort, and perhaps use it to tune baloon lofted vertical
wires on field day.

Any any all information or experience with this equipment would be most
appreciated!

>Greg.

Actually, there are some nice capacitors made with a capacitance of 1 Farad.
They are odd beasts, and are intended to be used instead of batteries in
devices like VCRs and such. They are a nice thing to use, since there is
no battery which will need to be replaced (and which could leak) later on.
In consumer electronics, such as VCRs, they keep the clock running during
short power outages.

> good features and bad/lack of features of each?

[Disclaimer: I'm still new at this myself, and quite wet behind the ears. There's probably more than a few optinions here that will change with experience.]

If you've narrowed it down to 78A, 79A or FT-530, you're pretty well done. Between these, let your own personal preference be your guide. They're all laden with more features then most folks use, so unless there is one specific feature you must have, it's a toss up. Price is close enough between them that local/seasonal deals will make the difference there.

Pretty much, let your own whim be your guide. I don't think there's any one overriding thing that makes one radio clearly better than the others. I have a FT-530, but it could have gone either way. I was totally new to the hobby when I bought it, and these are the incorrect assumptions I made:

- "All these features are neat."
I spent an evening figuring out all the details on Paging/DTMF squelch, and I've never used it once since. Others may use it often.

- "The keypad and direct entry will get used often."
This is what steered me from the 78A to the FT-530. I didn't like the keyboard cover and small buttons. Turns out that I don't use the keys much now that the memories are all programmed up. Before putting the radio on the belt, I need to turn on Keylock or the buttons get pressed. Perhaps the 78A-style keyboard cover would have been better.

- "I need lots of memory slots."
Naw.. Keeping track of 20 repeaters is about all I can handle right now. I'm having more fun hanging out on a select few than trying to be everywhere.

- "Cross-band repeat is really useful."
Never used it. For some, this might be an essential feature of the radio. For me, it's not necessary. My mobil rig does it, and with more power. Never needed that one either. YMMV.

- "It can double as a mobile rig."
What a hassle. I installed an antenna, got the 12v cigarette plug, and then needed an external speakermike to make it manageable. It's enough trouble that I didn't set it up except for long rides.
If you're looking to use it frequently from the car, think hard.

- "Gotta get 800MHz receive."
Yeah, I admit it. If you think this too, well, you'll probably get over it as soon as you achive it. Everyone I've talked to about their first radio purchase admitted this is a key feature. It must be the lure of the Forbidden Band.
That said, the FT-530 is a pretty poor 800MHz receiver. It's got lousy sensitivity, and the scanning step is wrong. If you want a scanner, buy one.

- "Intermod bad, and unavoidable."
I'm going to go out on a limb here and say that this really hasn't been a problem for me, even here is crowded San Diego. I even had to ask someone to explain to me what intermod is, since I don't seem to have that problem. It's just interference that might be avoided on a better radio. Personally, I don't do much with the HT that isn't either short-range or to a convenient repeater, so I don't run into it much. Again, Your Mileage May Vary.
Most folks agree that there isn't any significant difference between the three radios as far as intermod.

Battery life *is* important, and the auto-Rx saver is great. After some silence, it polls the signal every now and then instead of all the time. It *drastically* extends the standby battery life. Tx saver is less useful, since it can decrease your signal for the wrong reasons. I don't know if the Kenwoods have similar features.

As far as I know, the FT-530 is the only one with an internal voltmeter, which I really like. The 79A has that nice matrix display, but it lacks channel lock-out for scanning. The 78A has made lots of folks happy too.

So, try to think ahead as to what you will most often be doing with your HT, and then dive in and take your pick.

Happy Hacking!
-Steve

4851. WANTED ROANOKE DOPPLER BOARD!!!

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-09 02:40:21 UTC
From: scottm@primenet.com
Message-ID: <scottm.1.007D2FAA@primenet.com>
Source record: 223693

I am posting this for a friend who doesn't have a modem and a computer
that predates Heathkit HW-100s. He wants (needs) a doppler for local
T-Hunting because the short game played here makes his beam thru
the roof a bit slow. So if anyone knows how to get a hold of the Roanoke
doppler board advertised for years (but not lately) in '73s' magazine
can you please tell me where, who, and how much.

NEW: Q signal "QYL" used when the QRM from the YL makes operating
most difficult.

Thank You

4852. Need DX-302 specs...:(

Hi ppl.

MAYBE someone can help me. I just bought Realistic DX302 receiver (second hand)
and I haven't got the slightest idea what the specifications are.
Maybe someone came across one of them, sometime. Maybe. Probably :)

Thanx in advance.
Misel.

: and I can't guess the frequency alignment procedure... I was going
: to ask for a manual but it seems quicker if someone could tell
: me what the procedure is for setting the transmit frequency and receive
: frequency..

Dennis,
I don't have a service manual, but my instruction manual came with a
schematic. If you're technically savvy, you can glean the information
you need. If you'll send me an SASE, I'll send you a photocopy of the
manual.

To help get you going: it looks like VC401 adjusts the 9.000 MHz
oscillator's frequency, which can be measured at TP401. The 38.86667
MHz oscillator is set by VC402 and looks like it puts the receiver
on frequency. YMMV.

>>: BP-8 hates the HTX-202, or the other way around.
>>

Most HTX-202s will not take a BP-7 Icom pack. The BP-8 usually
works well. If the Zener diode in the bottom-feed circuit is bad,
only a 9.6-vdc pack or less will work. A minor headache at the
very least.

ALWAYS: Slide off your NiCad pack when using external DC power from
your vehicle or a power supply! Leaving the pack on while mobile puts
too much burden on the Zener diodes, and generates heat at twice the
normal rate. Save your radio and take off the pack!

Unlike it's Icom brother, the 202 will not top charge an Icom pack
while on external DC power. Refer to the warning above!

WARNING: DO NOT ATTEMPT TO BOTTOM-CHARGE THE STOCK NICAD PACK IN AN
ICOM BC-35 OR CLONE CHARGER.

DESIGN FLAW: Some early production (S/N 2500 and down) radios had
the NiCad Zener Diode located too close to the finals, causing
final transistor failure when used on external DC with the pack in
place. This was remedied in production, and Tandy will remedy
under warranty.

: inductances. I have an LCR meter (LCR 195) which I purchased from Alpha
: Elec. several years ago. This meter works great for measuring capacitance
: but just doesn't get it for measuring small inductances (uh range).

Grab an ARRL handbook & read the section on inductance. It gives
formulas for calculating inductance from length, diameter & number of turns.
It also gives methods of checking inductors with a grid dip meter.

Of course if you have a hundered K to spare you can get an HP8753C vector
network analyzer. In smith chart format when sweeping in the 100khz to
1mhz range, it will read inductances as low as you can make them. Its
also great for checking permability of core's 'n stuff, plus hundereds of
other things.

4856. RE: HT DUALBANDS/W21

Source record: 223672

Ne> I am looking at ICOM W21AT which
Ne> has a nice telephone style mechanism to allow you to talk without using
Ne> the PTT.

This is a feature with VERY LIMITED utility. In "Whisper Mode," the
transmitter is turned on continuously, the mic audio is switched to a
second mic in the bottom of the battery, and the speaker audio is reduced.

When using this mode, you must be talking to another dual-band radio, and
you are in full "crossband-duplex" mode. You have to hold the radio up to
your ear, and use it like a telephone handset. Unless you're using the
15 milliwatt power level, you'd be chewing up batter power pretty fast.

Another point about the W21 -- the speaker audio output is poor -- it's
impossible to hear the radio in even moderatly noisy settings without
holding it up to your ear (or using an earphone). Other than that,
it's a pretty good radio.

4858. VOX mike for HTX-202 or Icom-02AT?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-09 18:26:46 UTC
From: smp@agape.sol.net
Message-ID: <781727206.62snx@agape.sol.net>
Source record: 223677

I would like to know if it is possible to get a plug-in mike for the Radio Shack HTX-202 that would give it VOX capabilities. It probably wouldn't work as a speaker mike, since the speaker audio would most likely trigger the VOX circuit. :)

Anyone have any information on this type of thing?

4859. Drake R-8 use with xmitter

I am thinking about purchasing one of the Kenwood Tm733a dual band mobile radios that are now available. I have followed the dirty PL tone issue in the past, but the question I have relates to the detachable face plate. Can I purchase a kit to remote mount the faceplate (head?) of the radio away from the body of the TX? I have a small car and need a small radio with a detachable head and a TX I can put under the seat.

Any help will be gratefully appreciated,

tnx & 73s de KE4ITL

No you may not use the TH-79 on charge and use it at the same time. Well, I guess you could, but that would be an awful waist of money. I have had my 79 for about 2 months now, and enjoy it immensely. I got a rapid charger for it about two weeks ago and that is the first thing they warn about-not turning the 79 on while charging!!!

Can't understand the general eagerness to mod new radios specially in view of the microscopic electronics. It doesn't take much to make a mess of the PCB and that would certainly take some explaining to the dealer/Kenwood. I wonder if spare parts are generally available for such a new radio?

Why the eagerness to extend TX and RX beyond the range covered by your licence? As far as Tx is concerned, it is very risky as if your radio got stolen or lost, someone picking it up could cause chaos by possibly transmitting out of band. Then there is also the worry of someone picking up the radio and playing with it when you are not around...you know how people are attracted to a new gadget...they immediately switch it on and fiddle whilst your back is turned.

As far as RX is concerned, if one is nosey enough to listen around on the non-amateur bands, a purpose made Scanner would appear to be a better performer from a sensitivity viewpoint.

Why spoil a nice new HT with non-reversable internal diode mods?

Kenwood TH79 Dual Bander Modification and Feature Guide r1.0 8/21/94
=====================================================================
by Clayton Wagar, KD4IDN
920 West Crawford Street #7
Dalton, GA 30720

Here is a compiled list of modifications and features I've found for the
Kenwood TH79 Dual Band HT.

Most of these are borrowed from other operators, to whom we all owe thanks
for spreading information. I personally want everyone else to benefit from
what I've learned.

This is release 1.0 of this document, dated August 21, 1994.

If you have any other comments, mods, or information you would like to see
included in this document in the future, please send them to:
Clayton Wagar KD4IDN
yensid1@aol.com (fastest, since I travel 5 days a week)
wagarbc@mail.auburn.edu (ok alternate)

Outstanding questions at the time this document was released:

* Rumor of a keypad modification to the radio for "Wide band" TX, RX. If you
know of this mod, please write to me, even if you wish it not to be
published. This would save a number of poor radios from useless torture!

* Mods have not come from a Kenwood source, just experimentation by owners.

Hope you find all of this information useful. Again, please send corrections
or additions to yensid1@aol.com or wagarbc@mail.auburn.edu.

73 de Clayton
KD4IDN

++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++
TH79 Description and Impressions, by Mike Musick, N0QBF
++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++++

Lulled by the sexy small size, I succumbed (or, rather, the
credit card succumbed) and bought a Kenwood TH-79 dual-band H-T
recently. Already owning a TH-78, the comparison comes easy.

SPECS. The TH-79A is a U.S.-spec dual-band transceiver, featuring
coverage from 144-148 and 438-450 MHz. Receive coverage is
extended on the 2M side from 118 to 174 MHz with AM in the
aircraft band; there is no extended UHF coverage without
modification. Max power is rated 5W on VHF and 3.5W on UHF with a
```

12V source; max power with stock 600 mAH nicad pack is 2.5/2.0. There are three power levels for each band - high, low, and extra-low (30mW). There are 80 memory channels, with no evident expansion capability. U.S./Canada version comes with the CTCSS encode/decode option. Going price at a 7/17/94 hamfest was $480.

GENERAL IMPRESSIONS. Tiny, tiny, tiny. Imagine putting a small duckie on the ARRL Repeater Directory - except that the 79 is narrower by about an inch. With the standard battery and not counting the belt clip, the dimensions are roughly 2" wide, 5" tall, and 1" thick. The belt clip adds 3/8" to the thickness; I left it off so it would be pocketable, and, frankly, it fits moderately comfortably in my work slacks' front pockets, which was surprising. It's tiny! (Oh, I said that already.)

The 79's keyboard has larger buttons than it's predecessor (lacks the cover, too) which are much easier to use. Control layout in general is better and even in just a couple of days I appreciated the change. No more ambiguous power switch - it's in the primary band volume knob in a normal OFF/ON/VOL setup. Secondary band volume control is on the "ring" of the freq/channel encoder knob in a coaxial arrangement.

There are no squelch knobs; it a key+knob function for both bands. Squelch control was, well, interesting. There are only six "settings", with usually only the lowest setting opening the squelch under no signal. Reading between the lines in the manual, apparently the squelch circuit is semi-automatic. I expected some limitations, but had no complaints under actual use - it worked well.

With my expected habit of putting it in my pocket, I like the control lock switch - it's *not* an F-key function, but, rather is a slide switch next to the PTT. No more fumbling around to unlock it. Unfortunately, the lock function does not lock PTT - that has to be disabled with the "Tx Stop" menu setting. I found this out the hard way by putting it in my pocket and inadvertently keying-up a repeater.

The 79 has an alphanumeric display capability of two lines of 10 characters, which is used in several ways. First, there is a "guide" facility, which provides online instruction for most operation features with a scrolling display. Then there is a "menu" function, which provides access to the settings which were normally done with obscure F-key commands in the 78. Setting the various functions is very clear this way. There is also a status review mode, where the more important settings are displayed.

Finally, the alphanumeric display can be set for each programmed channel. Seven characters positions are available, and almost the entire extended ANSI character set - that's right: lower case, symbols, and accented characters - can be used. However, alpha

display is mutually exclusive with frequency display. Frequency display mode can be selected in case you forgot what was "underneath" your programmed channel ID.

PERFORMANCE. I was impressed, without a doubt. The '79's sensitivity is markedly better than the 78, in both bands and especially in the extended portions of VHF. And, spurious signal (intermod) rejection seemed to be much better as well in the side-by-side tests.

The stock antenna, however, was awful. I bought an ANLI 5" dual-band flexi and it made a huge difference - signals just breaking squelch with the stock duck were full-scale with the ANLI.

Audio is fairly good for something so small. The quality was marginally better than the 78 and tended to distort less at max volume settings. Audio power would be stretched to use it, say, with the car window open going freeway speeds.

Having loaned my wattmeter to a friend, I wasn't able to get transmitter measurements to confirm power ratings. Reports from those on the receiving end have been favorable so far, though.

ADVANTAGES. As mentioned previously, the 79's receiver quality is significantly better than the 78, in both sensitivity and intermod rejection. Battery life - even with the smaller batteries - is supposed to be drastically improved due to a number of design changes, particularly in the transmitter finals. Have not been able to confirm that. And then there's the size.

DISADVANTAGES. There are, unfortunately, a few. One thing that jumped-out very early was that there is no facility to "lock out" a channel from the memory scan. If you select memory scan (hold [MR] for 1 second), you get every channel programmed in the band active for that "side", whether you want it or not. IMO, this was a grave over sight on Kenwood's part. If someone knows how to do this or there is a "hidden" lockout function, please post it, because nothing in the manual even hints at being able to do this.

Another disadvantage, albeit minor, is that there are no clocks or timers. I normally eschew these gimmicks, but "on the road" I've made use of the timer feature in the 78 as an alarm clock. I'll miss it a little.

It has no 800 MHz receive, which the first two generations of TH-78 has. This isn't a hard disadvantage, because the current TH-78 has 800 MHz missing, too. I only mention this for current 78 owners who have pre-4/94 units.

And, so far it seems that there are fewer "hidden" features available, like cross-band repeat. I said "so far". There appears

to be no extended F-key function activated by holding down the F key for 1 second; most of those feature selections are covered by the menu display. But there's more exploring to do and we might just bump into something interesting in the next few days - "power on" has significance in one important command (memory channel clear), so it may be important in switching other modes.

MODIFIABILITY. I studied the schematics (supplied) for the usual strap selections for extended range and different markets. Yes, they are there. When the opportunity permits I will cross-reference the mod codes against other Kenwood schematics and determine where the range extensions are. HOWEVER, there is very clear allusion to an 800 MHz receive feature, and checking the component list for the U.S. version codes, it appears that *all* of the 800 MHz components are missing. Kenwood is meeting the "no cellular" requirement purely by eliminating the 800 MHz receive section altogether. So, technically, you would probably be able to mod it for 800 MHz receive, but getting all of the right parts (about 40 or 50 surface mount components) and getting them to work without destroying something borders on improbable.

Overall, I like it, though I'm really hacked by the lack of scan memory lockout - they *REALLY* messed-up by not including it.
...mm

P.S. After another day with the TH-79, I'm bumping my head against more limitations.

Another feature lost from the TH-78: special scans. With the TH-78, it was possible to have a variety of special scan conditions. One of my favorites was to load a freq into the "call" channel, and by holding [CALL] for one second it would flip back and forth between two freqs. I used this a lot, and it just isn't there on the 79.

Also, I spent some time trying various power-on key combinations and found absolutely nothing. One thing for sure - if it isn't in the manual, it isn't likely to be discovered accidentally.

The more I "explore" this rig, the more I get the impression that feature selection may be "back to basics". Kenwood might be a little sore after the TS-50 experience with the FCC and may feel the need to make access to "tweaks" a little less obvious.

++
MARS/CAP Modification provided by Mike Musick, N0QBF
++

Here is the MARS/CAP modification for the new Kenwood TH-79A dual-band HT. Usual disclaimers about doing mods apply.

1. Remove battery.

2. Open case by first removing 3 screws (#00 Phillips) on back
and 1 screw on side hidden underneath the rubber flap covering
the DC power jack. Gently pry apart starting at top; BNC
connector will move with back, knobs with front.

Spread unit out. Wires will "hinge" on the side with the PTT
button.

4. Looking on the back of the keypad (front) half, locate green
wire on upper left, just below the CTCSS decoder module.

5. Neatly cut this green wire, and tuck back in so ends won't
touch each other or other components.

6. Reassemble.

Programmed memory will be lost since the CPU will notice the
strap change and reset itself.

End result -

Before: VHF RX - 118.000-173.995 TX - 144.000-147.995
UHF RX - 438.000-449.995 TX - 438.000-449.995

After: VHF RX - 118.000-173.995 TX - 142.000-151.995
UHF RX - 420.000-449.995 TX - 420.000-449.995

Automatic repeater offset and shift selections remain normal.

If I read the schematic right, the green wire corresponds to
"W301", which also serves the same purpose as removing "D308".
More research needs to be done on other mods; I'm especially
interested in extending UHF receive beyond 450.

There is a row of diodes right below the uC which appear to be
D302 through D308, the configuration straps. HOWEVER - I need to
caution anybody thinking about playing with the diode straps that
it will not be a casual operation. For one thing, the diodes are
SMD "603" style - extra, extra tiny - and the plastic board
hold-downs molded into the front case are right on the landings
for most of the diodes. This means that the board will have to be
removed from the case (a very involved procedure), and working
with the tiny diodes *will* require magnification tools as well
as the correct micro-tip iron. It is not a job for the
inexperienced or all-thumbs.

Also, as noted previously, the non-US versions of the TH-79 have
an 800 MHz receive section. All RF components of this section are
not present in the US version. Frankly, it would easier to import
gray-market version of the radio than it would be to attempt
restoring this coverage in the US with parts.

++
"Wide Band" Modification, provided by Cole Cunningham, AA7RD
++

Following is a modification for the Kenwood TH-79A Dual Band HT which opens it up to tuning from 67-174 MHz and 400-511 MHz. Actual receive was 85-135.995 AM and 136-179.995 FM with reasonable (0.5 microvolt or better) sensitivity at all the points I measured. Transmit was 136-179.995 and 400-511 with power dropping off at the ends but still usable (about 0.5w on the high scale at the band edges).

As usual, I take no responsibility for the mods, or your use of the unit after mod. Please exercise good judgement and don't endanger our ham bands with your irresponsible actions.

The observations noted are all I tried and I have no further data. This is such a delicate operation that one shot was all I wanted to do, and when it worked I quit!!!

WARNING-CAUTION-LOOKOUT-ETC!!!
The diodes to be moved are microscopic!! About 1mm long by 0.5mm wide. This mod should be done by professionals on a closed track only. Children, do not attempt this at home. Requires extremely small soldering tools and MUCH skill. I had a professional surface mount facility do mine...

1. Open the unit by removing three screws from the back and one under the DC power input cover. Carefully separate the front and back pieces. The two case halves may be disconnected by pulling the wired plug and by prying the brown latch on the ribbon cable connector up enough to release it.

2. On the front PC board in the lower right corner as viewed from the rear with the knobs pointing up there are seven spots for diodes in a row, with one diode missing.

```
|
o o o o x o o |
_______________|
2 3 4 5 6 7 8
```

The numbers are D302-D308, left to right, with D306 missing.

3. Remove D304, and D307. Put them away in a safe place (Just in case...)_

4. You should now have:

```
|
o o x o x x o |
_______________|
2 3 4 5 6 7 8
```

5. Reassemble and good Luck.

Enjoy, but don't create problems with the new capability...Wouldn't it be nice if Kenwood would make a RX only mod with these capabilities and we wouldn't have to worry about accidental transmissions where we shouldn't be transmitting. I, for one, don't want or need to TX, just RX...

73, Cole, AA7RD
August 11, 1994

(Note - This mod also adds 2 more menu settings. One of which is an
AM/FM demod selector for the 300-400 Mhz band. To access this
band, select the VHF band, press F, then press the Low/Hi key.
Repeat to return to 144 Mhz. The AM/FM selector will allow you
to listen to Military transmissions in the 300Mhz band in
either AM or FM.
- Clayton)

++
Remote Base Operation with Kenwood 732/(733?), Clayton Wagar KD4IDN
++

Kenwood has now simplified remote base operation of their mobile rigs
with the TH79.

I will not give a step by step on how to control the mobile rigs, since
they are different. Hoewever, to really understand this feature, I would
first get to know the remote control feature on the mobile very well. This
makes the following explanation a little clearer!

To access this feature, hold [PTT] and [MR] while [POWER ON].

The display will indicate -RC-, which I presume means 'Remote Control'.

If you have correctly matched your DTSS codes, frequencies, etc, the
dual bander's keypad now becomes a function pad. Pressing certain keys
enables or disables functions on the mobile rig by sending the DTMF
sequences for you.

Please note that all this fuction does is send the DTMF tones over the air
to control your mobile rig. I have not made a list of what each key does,
but as the 79 sends the DTMF tones, the display will indicate the function.
(i.e. - RPT ON, RPT OFF, TONE ON, TONE OFF, etc.)

++
Post Modification Spec Sheet, by Clayton Wagar, KD4IDN
++

Here is a small chart showing the measured specifictions of TH79
S/N 60300272 after modification. The measurements were made with an
IFR 1200S Service Monitor, on the bench, with a 6V power supply.
Your milage may vary - these are just what happened with mine, and
I would suspect that most units are pretty similar.

Since everyone else has 2 cents about extended transmit, here's mine...
I think that everyone should have the right to modify their equipment
to suit their desires, within the law. However, as someone who has
exercised that right, I also think that those who use that capability
maliciously should be hung from the highest tree... ;)

There have been some claims that they cause cancer. It is by no means documented.

Laser is used because it is much harder to detect. The cops feel there are too many radar detectors on the road. They feel that this makes their revenue^h^h^h^h^h^h^hsafety enhancement efforts futile.

Closing the MUTE terminal on the back of the radio is not enough.
You must also be sure to disconnect the antenna when transmitting.
Some of the diodes in the early stages are very sensitive.

I learned this the hard way. Drake was nice enough to repair my
unit under warranty.

Kenwood TH79 Dual Bander Modification and Feature Guide r1.5 9/13/94
==========

Clayton Wagar, KD4IDN
920 West Crawford Street #7
Dalton, GA 30720

Here is a compiled list of modifications and features I've found for the Kenwood TH79 Dual Band HT.

Thanks to the following for their contributions to this document:
Mike Musick, N0QBF
Cole Cunningham, AA7RD
Duane Voth, KC5BGV
Chuck Scott, N8DNX

Having had many other radios in the past, and certain to have many in the future, I understand the anticipation of Amateur Radio operators to find modifications to their equipment. I started this document because I want to see _quality_ information circulated as quickly as possible, in order to save a lot of time and effort for others.

If you have any other comments, mods, or information you would like to see included in this document in the future, please send them to:
Clayton Wagar KD4IDN
yensid1@aol.com

Outstanding questions at the time this document was released:

* Rumor of a keypad modification to the radio for "Wide band" TX, RX. If you know of this mod, please write to me, even if you wish it not to be published. This would save a number of poor radios from useless torture!

Hope you find all of this information useful. Again, please send corrections or additions to yensid1@aol.com

++
I. Disclaimer
++

Well, don't you get sick of this stuff? I know, I know. However, I must say that I cannot and will not be responsible for anything that might happen to your radio, your person, your dog, or other operators you might talk to with your th79. In addition, if you decide that, with your newly modified HT, you just absolutely must cause unlawful interference with another ham or another radio service, I won't pay your NAL. Really.

Oh, and while we're at it... The extended RX/TX modifications may require you to solder or desolder really, really small components. If you want to know how small, look at the tip of an average ball point pen. Smaller than that. It takes about 1/2 of a second to wipe out several components as well as fry the board inside the 79. Please be careful.

++
II. TH79 Description and Impressions, by Mike Musick, N0QBF
++

Lulled by the sexy small size, I succumbed (or, rather, the credit card succumbed) and bought a Kenwood TH-79 dual-band H-T recently. Already owning a TH-78, the comparison comes easy.

SPECS. The TH-79A is a U.S.-spec dual-band transceiver, featuring coverage from 144-148 and 438-450 MHz. Receive coverage is extended on the 2M side from 118 to 174 MHz with AM in the aircraft band; there is no extended UHF coverage without modification. Max power is rated 5W on VHF and 3.5W on UHF with a 12V source; max power with stock 600 mAH nicad pack is 2.5/2.0. There are three power levels for each band - high, low, and extra-low (30mW). There are 80 memory channels, with no evident expansion capability. U.S./Canada version comes with the CTCSS encode/decode option. Going price at a 7/17/94 hamfest was $480.

GENERAL IMPRESSIONS. Tiny, tiny, tiny. Imagine putting a small duckie on the ARRL Repeater Directory - except that the 79 is narrower by about an inch. With the standard battery and not counting the belt clip, the dimensions are roughly 2" wide, 5" tall, and 1" thick. The belt clip adds 3/8" to the thickness; I left it off so it would be pocketable, and, frankly, it fits moderately comfortably in my work slacks' front pockets, which was surprising. It's tiny! (Oh, I said that already.)

The 79's keyboard has larger buttons than it's predecessor (lacks the cover, too) which are much easier to use. Control layout in general is better and even in just a couple of days I appreciated

the change. No more ambiguous power switch - it's in the primary band volume knob in a normal OFF/ON/VOL setup. Secondary band volume control is on the "ring" of the freq/channel encoder knob in a coaxial arrangement.

There are no squelch knobs; it a key+knob function for both bands. Squelch control was, well, interesting. There are only six "settings", with usually only the lowest setting opening the squelch under no signal. Reading between the lines in the manual, apparently the squelch circuit is semi-automatic. I expected some limitations, but had no complaints under actual use - it worked well.

With my expected habit of putting it in my pocket, I like the control lock switch - it's *not* an F-key function, but, rather is a slide switch next to the PTT. No more fumbling around to unlock it. Unfortunately, the lock function does not lock PTT - that has to be disabled with the "Tx Stop" menu setting. I found this out the hard way by putting it in my pocket and inadvertently keying-up a repeater.

The 79 has an alphanumeric display capability of two lines of 10 characters, which is used in several ways. First, there is a "guide" facility, which provides online instruction for most operation features with a scrolling display. Then there is a "menu" function, which provides access to the settings which were normally done with obscure F-key commands in the 78. Setting the various functions is very clear this way. There is also a status review mode, where the more important settings are displayed.

Finally, the alphanumeric display can be set for each programmed channel. Seven characters positions are available, and almost the entire extended ANSI character set - that's right: lower case, symbols, and accented characters - can be used. However, alpha display is mutually exclusive with frequency display. Frequency display mode can be selected in case you forgot what was "underneath" your programmed channel ID.

++
III. MARS/CAP Modification provided by Mike Musick, N0QBF
++

Here is the MARS/CAP modification for the new Kenwood TH-79A dual-band HT. Usual disclaimers about doing mods apply.

1. Remove battery.

2. Open case by first removing 3 screws (#00 Phillips) on back and 1 screw on side hidden underneath the rubber flap covering the DC power jack. Gently pry apart starting at top; BNC connector will move with back, knobs with front.

3. Spread unit out. Wires will "hinge" on the side with the PTT button.

4. Looking on the back of the keypad (front) half, locate green wire on upper left, just below the CTCSS decoder module.

5. Neatly cut this green wire, and tuck back in so ends won't touch each other or other components.

6. Reassemble.

Programmed memory will be lost since the CPU will notice the strap change and reset itself.

End result -

Before: VHF RX - 118.000-173.995 TX - 144.000-147.995
UHF RX - 438.000-449.995 TX - 438.000-449.995

After: VHF RX - 118.000-173.995 TX - 142.000-151.995
UHF RX - 420.000-449.995 TX - 420.000-449.995

Automatic repeater offset and shift selections remain normal.

And this tip comes from Duane Voth, KC5BGV...

"The MARS/CAP mod can be made without opening the entire case up. You can fairly easily cut the green wire by simply (and carefully) removing the CTCSS decoder cover and using a small pair of diagonal wire cutters."

++
IV. "Wide Band" Modification, provided by Cole Cunningham, AA7RD
++

Following is a modification for the Kenwood TH-79A Dual Band HT which opens it up to tuning from 67-174 MHz and 400-511 MHz. Actual receive was 85-135.995 AM and 136-179.995 FM with reasonable (0.5 microvolt or better) sensitivity at all the points I measured. Transmit was 136-179.995 and 400-511 with power dropping off at the ends but still usable (about 0.5w on the high scale at the band edges).

As usual, I take no responsibility for the mods, or your use of the unit after mod. Please exercise good judgement and don't endanger our ham bands with your irresponsible actions.

The observations noted are all I tried and I have no further data. This is such a delicate operation that one shot was all I wanted to do, and when it worked I quit!!!

WARNING-CAUTION-LOOKOUT-ETC!!!
The diodes to be moved are microscopic!! About 1mm long by 0.5mm wide. This mod should be done by professionals on a closed track only. Children, do not attempt this at home. Requires extremely small soldering tools and MUCH skill. I had a professional surface mount facility do mine...

1. Open the unit by removing three screws from the back and one under the DC power input cover. Carefully separate the front and back pieces. The two case halves may be disconnected by pulling the wired plug and by prying the brown latch on the ribbon cable connector up enough to release it.

2. On the front PC board in the lower right corner as viewed from the rear with the knobs pointing up there are seven spots for diodes in a row, with one diode missing.

```
|
o o o o x o o |
_______________|
2 3 4 5 6 7 8
```

The numbers are D302-D308, left to right, with D306 missing.

3. Remove D304, and D307. Put them away in a safe place (Just in case...)_

4. You should now have:

```
|
o o x o x x o |
_______________|
2 3 4 5 6 7 8
```

5. Reassemble and good Luck.

Enjoy, but don't create problems with the new capability...Wouldn't it be nice if Kenwood would make a RX only mod with these capabilities and we wouldn't have to worry about accidental transmissions where we shouldn't be transmitting. I, for one, don't want or need to TX, just RX...

73, Cole, AA7RD
August 11, 1994

(Note - This mod also adds 2 more menu settings. One of which is an AM/FM demod selector for the 300-400 Mhz band. To access this band, select the VHF band, press F, then press the Low/Hi key. Repeat to return to 144 Mhz. The AM/FM selector will allow you to listen to Military transmissions in the 300Mhz band in either AM or FM.
- Clayton)

++
V. Remote Base Operation with Kenwood 732/733
++

Kenwood has now simplified remote base operation of their mobile rigs with the TH79.

I will not give a step by step on how to control the mobile rigs, since they are different. Hoewever, to really understand this feature, I would first get to know the remote control feature on the mobile very well. This makes the following explanation a little clearer!

To access this feature, hold [PTT] and [MR] while [POWER ON].

The display will indicate -RC-, which I presume means 'Remote Control'.

If you have correctly matched your DTSS codes, frequencies, etc, the
dual bander's keypad now becomes a function pad. Pressing certain keys
enables or disables functions on the mobile rig by sending the DTMF
sequences for you.

Please note that all this fuction does is send the DTMF tones over the air
to control your mobile rig. I have not made a list of what each key does,
but as the 79 sends the DTMF tones, the display will indicate the function.
(i.e. - RPT ON, RPT OFF, TONE ON, TONE OFF, etc.)

73 de Clayton
KD4IDN

And this from Chuck Scott, N8DNX...

"The "RC" function is configured to directly control radios such as
the TM-732. In fact, if you look at the layout of the microphone remote
commands for the 732 it very closely matches the key assignments for of
the "RC" mode. Since I have a TM-732 installed in my car, I had a chance
to try this out and it's VERY convenient. Everything from direct frequency
entry with the "F" key to enabling X-Band repeat. I'm really surprised
they aren't marketing this feature of the radio."

++
VI. Post Modification Spec Sheet, by Clayton Wagar, KD4IDN
++

Here is a small chart showing the measured specifictions of TH79
S/N 60300272 after modification. The measurements were made with an
IFR 1200S Service Monitor, on the bench, with a 6V power supply.
Your milage may vary - these are just what happened with mine, and
I would suspect that most units are pretty similar.

++
VII. Cross Band Repeat, from Chuck Scott, N8DNX
++

The TH-79 does go into X-Band repeat. Press the "F" key then the "MONI"
key to enter repeat mode. Use the same to return to normal. There is a
10 min transmit limit so it's not useable for long duration monitoring of
a continuous transmission. That's understandable in light of the number
of horror stories I've heard of people frying their HT's in repeat mode.

++
VIII. Other Observations, Ramblings, Etc.
++

From Chuck Scott, N8DNX....

"Regarding the lack of a memory Lock Out function, I talked at length with the Kenwood people. They have been inundated calls about this and have told me that they are preasuring Japan to come up with a processor replacement to fix this, perhaps as a retrofit. I encourage any owner of a TH-79 to write to Kenwood insisting on such a modification at no cost and asking that they be informed when it is available. I think this is justified for several reasons. First, I have been told by another ham that the official brochure indicates that such a feature is included. Second, and more important, it is arguable that the radio is not suited to the application without memory lockout. After all, it's an 80 channel radio. To make effective use of that many channels REQUIRES a channel lockout function. Without effective use of that many channels, the radio is not comparable to the current standard for such a unit.

BTW, close inspection of the RF deck in my radio shows no obvious missing parts. I didn't remove the board to check the other side, but my suspicion is that the 800 MHz parts are installed. I'd be interested in input from others on that. So far I've not discovered how to make it display any 800 MHz frequencies though."

>revenue^h^h^h^h^h^h^hsafety enhancement efforts futile.
>
>Bill
>
Man,
My first job after college was as an engineer at Lincoln Lab with the LASER Group! Lasers are easily "absorbed". They use a frequency of light that is easily absorbed with g.$a#*)(@@@@ , I don't want to get into trouble. Also LASER RADAR can be jammed just like Microwave RADAR! You transmit the calibration signal!

NOW AS FAR AS CANCER GOES.... TALK TO ANY SEASONED HAM! even 73cm is harmfull with handhelds! if 440Mhz causes cancer imagin what a flip phone does at 820Mhz!

Rhode Island and Conneticut State Police did a study and the cancer rate is alarming!

the circuitry used to drive the LASER DOPPLER RADAR is also hazardous though, the LASER is pulsed at @1Ghz!

I suggest you read up on bio physics!
all matter, including our cell structure is bipolar.
that's why gravity has an effect on our body

It's been found that if the magnetic field gets stimulated while our cells divide.... well the DNA code can get mangled the cell forms a mass.. it forgets to die after it split 50 times

Thats why children who live near high power lines or well...
you draw the conclusion... birth defects al that stuff

I don't know about you but I wouldn't want a 250Watt RADAR sitting on my lap

and yep that's how some cops used it for speed!

Source record: 223688

I've had a chance to use both the Kenwood 78A and the Yaesu 530.
Both are good rigs, but I think the Kenwood definitely has the edge.
Battery life is better, it seems to reject the intermod more than the
Yaesu, and it seems mechanically better built to me.
I note you've rejected the Icom W21AT. That is a very fine
dualbander as well, better also than the Yaesu in my personal opinion.
Happy shopping. 73 Dave AA5NU

>35-1200+.

Assuming you mean spectrum analyzer in the test equipment sense...
Your best bet is an Hewlett-Packard system:
HP 141T display section
HP 8552A/B IF Section
HP 8554B RF Section
This will give you honest-to-God spectrum analysis from 100 kHz to 1.5 GHz
in a single 10" tall rack, with selectable resolution bandwidth, reference
levels, scales, etc. It will do it all.
You can get these items one of two ways: from many of the "surplus"
equipment vendors (Tucker, etc.) for around $2000; or you can shop your
local hamfests and things like HTYS, Nuts+Volts, etc., and find a setup
for around $1100. Or you can get lucky and hit a surplus electronics
auction like I did this weekend. You could have gotten the above setup
for around $700 complete.

This is being posted for a friend. I can answer as many questions as
I know the answers for, via E-mail.

For Sale

K-Band Radar *GUN* unit.

Operates on 24Ghz
(Some may be tempted to alter the radio to work in the ham-band, this
is why this has been cross posted to .homebrew and .equipment)
Runs off 12VDC (Comes with 12VDC Cigarette Lighter Plug)

This has been advertised on various newsgroups before, but the seller
lost their net access along with all prospective purchasers.

(2 or 3 were interested and bidding)

Their addresses have been lost along with the mailbox of the account
which was nuked.

If you are interested, simply reply here. I'm helping my friend sell
this unit.

*** Possible Items for Trade or Trade w/Cash ***

-Mobile scanner with 46mhz, VHF, UHF, 800 including Cel Tel, Etc.
-Dual Band 2m/440 Mobile radio with detachable faceplate.

*** Asking Price ***

$250 Cash (Repair shop lists this unit at $500)

Purchaser pays all s&h, No COD's.
^
^- Thus purchaser chooses options of shipper, insurance, etc.

"I've used this unit various times to clock different targets. It has
come in very handy for a friend who was clocking his high performace
car at the track. "

(You could acctually clock cars at a race with this if you bought an
easy to carry 12vdc power source)

*** All interested replies ***

Direct your replies to me via e-mail at:

br260@po.cwru.edu

If you have problems with the above address, you can send mail to:

root@b63062.cwru.edu (ONLY if the above address does not work)

If sending mail to the root address, make the subject of your
mail state: Pass this on to the old 'jbourne'

Thanks!

: Microwave RADAR! You transmit the calibration signal!

It can be absorbed - at least most of it can - if you are willing to
paint the complete front end of your automobile with the proper substance.
Windshields will also, in many cases, return a sufficiently strong signal.

If they have a calibration signal. If they are using T and D radar, then
there is no such signal. Even if there was, the officer would know what
was happening, just as they know with current radar. Such jamming happens
to be highly illegal, for a number of reasons, and is likely to get you
into far more trouble than a simple speeding ticket.

: NOW AS FAR AS CANCER GOES.... TALK TO ANY SEASONED HAM! even 73cm is
: harmfull with handhelds! if 440Mhz causes cancer imagin what a flip
: phone does at 820Mhz!

All we have is rumor, and some very uncontrolled studies. I don't
know of any Hams who have quit using handhelds because of a reputed
cancer risk.

: Rhode Island and Conneticut State Police did a study and the cancer
: rate is alarming!

If I recall correctly, the studies were uncontrolled. However, I would
like to see followup studies with other police groups - done properly.
I would also like to see another study done on the RI and Conneticut
Police.

: the circuitry used to drive the LASER DOPPLER RADAR is also hazardous
: though, the LASER is pulsed at @1Ghz!

I understood that they were not using doppler radar - but T and D
radar - fully accurate enough, and much less expensive.

: I suggest you read up on bio physics!
: all matter, including our cell structure is bipolar.

What does this mean?

: that's why gravity has an effect on our body

: It's been found that if the magnetic field gets stimulated
: while our cells divide.... well the DNA code can get mangled
: the cell forms a mass.. it forgets to die after it split 50 times

What magnetic field? Is there a counter in each cell that tells it
how many times it divides? I understood was that the DNA caused it
to split frequently, instead of at the normal rate.

: Thats why children who live near high power lines or well...
: you draw the conclusion... birth defects al that stuff

The power line studies are in some dispute. For example, the energy
fields from your vacuum cleaner and electric blanket are stronger than
at normal distances of a house from power lines.

: I don't know about you but I wouldn't want a 250Watt RADAR sitting on my lap
:
: and yep that's how some cops used it for speed!

How did they do this? All the ones I have seen had the transmitter in the
head - which was aimed at the automobile. Kind of hard to do that if you
are holding it in your lap. The readout unit may have been held in their
laps, however - and they may have contained a high voltage power supply.

4879. Ken TH-22AT mods? Please?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-10 08:31:07 UTC
From: dbarton@unix.cc.emory.edu
Message-ID: <37au4b$q13@emoryu1.cc.emory.edu>
Source record: 223690

This is my third request for mods to the Kenwood TH-22AT. Is it possible that there are no known mods? The salesman alluded to some but was he just blowing smoke? I have been very happy with the unit as-is, but, well, you know... ;-)

If you know some mods, but are shy about posting them, mail them to me and I will post them anonymously for you (unless you request otherwise).

Thanks for any help.

Doug

4880. Second battery or Intelligent Charger?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-10 09:20:43 UTC
From: vjpachiano@ccgate.dp.beckman.com
Message-ID: <vjpachiano.125.000958B6@ccgate.dp.beckman.com>
Source record: 223566

I recently bought my wife a cellular phone (mainly for emergencies).

We all know that Ni-Cad batteries should be fully used each time prior
to recharge, or else "memory" set in.
So consequently, I wait until her battery is nearly dead before charging it
(With the phones built in charger circuitry)
The phone has a rudimentary battery meter on the display pad.

My fear is that when she really needs to use it, the battery power will
be nearly exhausted, since I don't recharge until nearly empty.

So my options are:
1. Buy a second battery ($50 - 60 USD), and rotate the batteries by
keeping the fully charged battery in the glove box.

2. Buy a "Intelligent Charger/Conditioner" ($90 - 100 USD).
This gadget first discharges the Ni-Cad, then performs a 1 hour rapid
recharge.

Any suggestions?
Any recommendation of places to buy in So. Calif? Or mail-order?

p.s. While this question does not fit perfectly in this group, I hope that it
is sufficiently benign :-)

Regards, Vince
Opinions expressed may not be correct,
but at least they're my own.

>: phone does at 820Mhz!

I think the portable cellular phones are only .6 Watts, right? The
true mobiles are 3 Watts. Not that it doesn't deserve consideration.

>All we have is rumor, and some very uncontrolled studies. I don't
>know of any Hams who have quit using handhelds because of a reputed
>cancer risk.

I agree with the "very uncontrolled studies" comment. I've often wondered
about the validity of ANY cancer studies on amateur radio operators.

What's our average age anyway? Older people usually DO have a higher
cancer rate compared to the average population.

I've also noticed a sedentary lifestyle for the majority of the amateur
population around here. Much easier to "sit in the shack" (say that three
times real fast ;-) doing DX year after year rather than keeping the old
cardiovascular system in shape. If we DO get out of the shack, it's for
coffee and donuts! ;-) There is field day of course. That once-a-year
exercise. While I've only been invloved for about 2-years now, I've
experienced the decrease in physical activity myself.

Not that there shouldn't be more studies. RF/EMF can be a very dangerous
thing.

>
>What does this mean?

It means cells are affected by electric fields, same way a bar magnet will align with an external magnetic field. It's the principle behind electrophoresis. During cell division, while the nucleus is splitting, the cell is particularly vulnerable to electric fields. As far as I know, magnetic fields aren't implicated in this at all.

>: that's why gravity has an effect on our body

Of course this is nonsense.

>: It's been found that if the magnetic field gets stimulated
>: while our cells divide.... well the DNA code can get mangled

Apparently there *is* a form of counter in the cell. Cell death is programned in, otherwise we'd all live forever. What exactly that mechanism is, is still under intense research. We do know that cancer cells don't have it, and so proliferate indefinitely. Some cancer tissues have been kept alive in vitro for decades with no signs of aging.

>: I don't know about you but I wouldn't want a 250Watt RADAR sitting on my lap

Well, obviously, the handheld radar guns used by police are *not* 250 watts. They are in fact in the range of 10 *milliwatts* to 25 *milliwatts*. However, cops are in the habit of resting the guns in their laps when they

aren't actively clocking a vehicle, and they *don't turn them off* for the entire shift. So they get a good near field dose to the testicles. Testicular cancer rates are higher among police who do traffic patrol. Figure what the power density is right at the mouth of a 17 db standard horn and you'll see the levels they are getting are above ANSI limits. This is also why you should never look into the antenna of a microwave transmitter, no matter if it is very low power. The ERP can still be above safety limits at very close range.

I put the dots on the left paddle, the dashes on the right paddle. Lefties, on the other hand, might want to reverse it. But then some righties might want the dots on the right and the dashes on the left ... gets confusing after a while.

If there is such a thing as convention ... the old mechanical bugs had the dots on the left and the dashes on the right. Guess most people wire there newfangled paddles that way also.

>I bought a Bencher iambic paddle at a hamfest and, having never used one
>before, am not sure how to wire it. Which side gets the dots, which the
>dashes?

John,

You may suit your own needs there.
There are several schools of thought:

As to the hand used:
Many including myself use the right hand, some OM's maintain that
using the left hand is preferable, for ultimate speed and for taking
notes in a QSO.

Over here most OM's are keying the dots with the thumb, for traditional
reasons (when only dots were automatic). But it is obviously better to
key the dots with the index finger, since it is more skillful than the thumb.

I beleive most keys are for right-hand and thumb-dots.

: got stolen or lost, someone picking it up could cause chaos by
: possibly transmitting out of band. Then there is also the worry of
: someone picking up the radio and playing with it when you are not
: around...you know how people are attracted to a new gadget...they
: immediately switch it on and fiddle whilst your back is turned.

: As far as RX is concerned, if one is nosey enough to listen around on
: the non-amateur bands, a purpose made Scanner would appear to be a
: better performer from a sensitivity viewpoint.

: Why spoil a nice new HT with non-reversable internal diode mods?

Well, I don't want extended TX. I only want extended RX. During the BIG
earthquake here, I grabed ONE radio. That radio was my HT. It had been modified
to extended recieve. I used it to listen to the FIRE and POLICE and the local
emergency repeater. I gathered lots of information about the extent of the
damage by a combination of all. The Fire department was worried about a
toxic gas cloud that was headed my way. There was not way else for me to
have that information. I later monitored that frequency to find out it
was only CO2. I also learded about a damaged hospital that was being evacuated
that is the closest to me and if I needed medical help I knew to go to the
other close hospital.

I won't say I don't listen to the fire and police just for fun. I do. But
the value of all frequencies in one radio should not be under stated. I agree
that mucking around a surface mount radio can get you trouble. I work around
SMT and chip-on-board and have access to the right equipment. I wish the
radios would be shipped to me with extended RX in the first place. Or
atleast a keyboard mod (my ICOM W2A has a simple keystroke).

Anyway the next time you are in a magnitude 8.0 earthquake and only have your HT you might be thinking about extended RX too!

>after a while.

Maybe I'm semi-ambidextrious, but I wire it "right-handed" (dashes on
right) but send with my left hand (I write right-handed). Then I don't
have to alternate between trying to pick up my pencil to copy and sending
in a pileup--just keep pencil in hand to take the notes.
But then again, I sweep (with a broom) and play hockey left handed, so...I
guess all that RF caught up with me.

I friend of mine has a dead Yaesu FT-747 HF transceiver that was damaged in shipment (UPS). I have not seen the radio but I was told that the top was slightly dented and the front panel looks like someone removed it with a crowbar. The basic radio carcass looks to be in reasonable shape but the front panel is pretty much a gonner. Yaesu wants over $400 to repair it.

Fortunately it was insured. UPS paid the claim and returned the dead radio.

Anybody want it? Probably has lots of good parts. Make an offer.
I will pass the info along.

The fast chargers, particularly those that offer a conditioning cycle, are definitely worth having. But you do also want a second battery. In my case, my Oki 1150 came with two batteries, a standard one and an extended capacity one. I mostly use just the extended capacity, which lasts several days on charge, given my usage pattern. When I suspect I'm getting near the end of the charge, I just slip the slim battery in my pocket when I go out, just in case.

4897. Help re-crystal a Wilson MH-400 HT

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-10 18:30:43 UTC
From: riyadth@boi.hp.com
Message-ID: <CxGzF8.Epw@boi.hp.com>
Source record: 223558

Hello,

I just came home with a Wilson UHF HT, model MH-400, that I would like to re-crystal for the Amateur bands. Currently the unit is set up for 465.375/460.375 and 460.075/460.075 (according to a sticker inside the case), and I would like to make it work with our local repeaters. Does anyone have any information on how I could go about such a task, such as an address for Wilson Electronics, Inc.? Or better yet, first-, second-, or third-hand information on how to proceed (ie, what crystals to order, from where, and how to re-tune the radio for these crystals)?

Also, other information would be very useful. The radio had no NiCd battery, but rather had 2 9v battery clips soldered to the battery contacts in parallel, and was using these batteries to provide power. I would like to know what battery I would need (voltage and a source) to replace it. I will probably make a drop-in charger for the radio, if I can get it to work.

Finally, the squelch knob on the radio has a click-position marked 'TONE'. I am led to believe by this that the unit can be equipped with CTCSS (or equivalent), although there is nothing connected to the TONE switch inside the radio. Are such boards available for this unit?

I have not undertaken such a project before, but I don't feel intimidated by the electronics aspect, I'm just in need of more information. Thanks for any and all help.

Thomas de Lellis (tom@kontron.de) wrote:

> Anyone out there with an HTX-202 experiencing the following when
> placing their HT in powersave mode?

I posted this early in 1993 when the HTX202 first hit the market. R/S may have fixed some of the bugs by now. Anyway:

---//---

The HTX202 is proving to be a pretty popular radio. It well should be, it was selling at a super price during Radio Shack's sale of a week or so ago.

However, as others mentioned previously on the net, I found a few undocumented "features" in my HTX202 and others I've tried out. Here's my findings on my particular unit; it's pretty subjective, so take it with a grain of salt if you want.

1. There is indeed an in-band receive spur at 146.76. This signal is radiated out the transceiver's case and into the rubber duck antenna. It reads about 3-5 on the LCD S meter. You won't hear it with an external antenna removed any distance from the radio itself. Fishing around with an antenna probe shows most of the radiation coming from the keypad. I haven't figured out all the "tweets" associated with this radio, but at first glance this spur appears to be caused by the 41st harmonic of the uP clock (operating at 3.579545 Mhz). Changing the crystal frequency would move the spur to a less-popular channel, but might throw off some of the radio's timing and affect DTMF/CTCSS tone accuracy providing these are generated by the CPU. BTW, if you hold the HTX202 close to the antenna of a communications receiver tuned to 3.58 Mhz, you can hear the color-burst crystal radiation. You can also hear the 146.76 spur on another 2-meter radio held close to the HTX202.

2. The second weirdness involves the power save option. With the radio's duty cycle (PS in the configuration menu) set at something less than 1-8, and SAVE feature enabled, the RPG (tuning knob) hangs up when manually selecting memory channels. The up/down buttons work normally, as does the 1-16 duty cycle.

3. Another interesting glitch is the way the radio behaves when the battery fails. When the "batt" icon appears on the LCD screen, you will not have much time left for transmission. Further transmitting will blank out the LCD display screen, but the radio keeps transmitting at the last selected frequency, although with some very hairy-sounding sidebands. Releasing the PTT switch does nothing - the radio keeps

transmitting until the power is switched off. You also can't get any mike audio thru the transceiver at this point.

4. I find the DTMF REPLY feature unusable with transceivers having long DTMF/PTT transmit hangtimes. By the time the inquiring transceiver has gone back to receive, the HTX202 has already sent out the DTMF # reply. I think the HTX202 should really respond after some time delay or upon local squelch closure to make sure the inquiring transceiver has recovered back to receive mode.

The receiver is pretty sensitive. I checked mine at about 0.18uV/20 db quieting. The first LO leakage out the antenna port is about -57dbm. As mentioned previously, I also found a lot of the leakage coming from the keypad area. BTW, the first LO radiation falls from 122.6 to 126.6 Mhz, so I'd be pretty careful using this radio near operating aircraft.

Someone mentioned transmitter hang-on when tone squelch is used. My unit stops sending PL tone as soon as the PTT is released and the transmitter drops off about 100 milliseconds later. The unit doesn't send out any type of "reverse burst".

Anyway, great radio, great price. Anyone know when the HTX202A is coming out?

It depends which version of the phrase 'digital squelch' your school uses. Dollars to doughnuts- they use a variation of Moto's DPL, or DCS, or GE calls it DCG (all the same stuff). This is like PL, in that a subaudible code is sent constantly- but instead of one constant sine wave- DPL pulses out a code- akin to very, very, very old pagers (not a conincidence).

For some reason, the amateurs, as well as the companies selling us radios, market DTMF squelch systems as 'digital squelch'. Well--- yea, sorta. These are audible- usually consist of 3-4 MaBell-esqu tones in sequence. Less data permutations than DCS, slower (probably .75 secs for a 4 digit code, using my experience with ham HTs versus 0.179 ms [or so says Comm Spec] for true digital), and audible to others monitoring.

I've seen DTMF units in the commercial radio mags, but not many... so probably not used much. If you want to use your TH78 in this application- you'll need to spend $59 for a Comm-Spec board- and then figure a way to fit it in the radio (really small surface mount-chip board, but might not fit in your radio).

Good luck.

Hey guys, remember we're hams. All you need to accomplish this feat is
a mono 2.5 mm plug, a stereo 2.5 mm socket, 3 AA cells, and some wire.
If you don't know how to wire it up from this description, send me an
email at CecilMoore@delphi.com along with your snailmail address
and I'll send you a schematic.

: >
: >: I suggest you read up on bio physics!
: >: all matter, including our cell structure is bipolar.
: >
: >What does this mean?
:
: It means cells are affected by electric fields, same way a bar magnet
: will align with an external magnetic field. It's the principle behind
: electrophoresis. During cell division, while the nucleus is splitting,
: the cell is particularly vulnerable to electric fields. As far as I
: know, magnetic fields aren't implicated in this at all.

Note that the person said "all matter". That is why I was wondering about
the usage of the term.

: >How did they do this? All the ones I have seen had the transmitter in the
: >head - which was aimed at the automobile. Kind of hard to do that if you
: >are holding it in your lap. The readout unit may have been held in their
: >laps, however - and they may have contained a high voltage power supply.
:
: Well, obviously, the handheld radar guns used by police are *not* 250 watts.
: They are in fact in the range of 10 *milliwatts* to 25 *milliwatts*.

Correct.

: However, cops are in the habit of resting the guns in their laps when they
: aren't actively clocking a vehicle, and they *don't turn them off* for the
: entire shift. So they get a good near field dose to the testicles. Testicular
: cancer rates are higher among police who do traffic patrol. Figure what the
: power density is right at the mouth of a 17 db standard horn and you'll see
: the levels they are getting are above ANSI limits. This is also why you should
: never look into the antenna of a microwave transmitter, no matter if it is
: very low power. The ERP can still be above safety limits at very close range.

All the units I have seen have a trigger on them - so called "instant on"
units. There might be a high EM field, but no microwaves. Are the cops so
stupid that they would rest the mouth of an active radar unit on their
testicles? Highly unlikely.

Even if this were not true, I would expect the reflected waves to be much
higher than any leakage signal through the casing. Add in standing waves,

and you could get quite a few local hotspots - that would change position every time the unit moved a fraction of an inch.

Maybe the get the cancer from the sugar in their doughnuts.

Bill

I'm not trying to start anything, simply looking for clarification. Why would it be illegal to transmit infrared laser? I wasn't aware there were any regulations on transmitting light of any frequency/pulse duration or coherency. Am I simply misinformed? Or are there other laws in effect here?

I'll sit back and listen now...

Actually, most of the officers that get this form of cancer are motorcycle
officers since they must rest their gun near this part of their body
when chasing a car.
Also the officers in autos may incidentally rest the gun there if they
throw it down in a hurry to chase a "speeder".
It's not done by choice, that's guaranteed...

>From the Motorola digital cell phone manual:

>>TDMA digital technology is more secure than analog technology,
>>making it less susceptible to interception by third parties with
>>scanners or other listening devices (NO! :-).

NO?

TDMA multiplexes THREE conversations into the same bandwidth used by
a SINGLE conversation in the conventional NAMPS analog system. The
data is also digitally compressed. Most individuals (including MOST
radio amateurs) would not have the ability to intercept and decode
these transmissions.

It remains to be seen if cellular phone manufacturers will continue to
have a software test mode option (available from the phone's keypad)
that will allow the phone to "scan", receive and decode any cellular
"channel".

Still, you are correct that a "simple" modulation technique (even
spread spectrum) is NOT a form of security. Cryptography is the
solution. If security IS an issue, the data should be encrypted
prior to transmission, regardless of the modulation technique employed.
While the casual listener may not have the initiative or resources
to intercept digital cellular, a sufficently motivated organization or
individual will (and can) do so, if they really want your "data".

> For even more
>>security, the Voice Privacy feature scrambles a digital
>>conversation as it passes over the air. The Voice Privacy
>>feature will request a secure voice channel in all call cases...

There are analog scramblers (employing techniques far more
sophisticated than speech inversion) available (from companies
such as Transcrpyt and MX-COM) for both analog cellular phones and
VHF/UHF business and public-service band 2-way radios.

If you're really interested in cellular and can afford to spend about
$100.00 on a good book, try "Cellular Radio: Analog and Digital
Systems" by Asha Mehrota. It is an EXCELLENT book on the PRACTICAL
implementation of these technologies (rather than a theorectical,
PhD-level discussion of spread-spectrum and other digital techniques).

Ne> put under the seat.
Ne> Any help will be gratefully appreciated,

Ne> tnx & 73s de KE4ITL Warren Whitby wwhitby@aol.com

Yes -- in fact there are three somewhat different kits available,
according to my brochure. Their part numbers are DFK-3B, DFK-4B and
DFK-7B. The 3B is 3 meters (10 feet)long, the 4B is 4 meters (13 feet)
long, and the 7B is... you guessed it, 7 meters (21 feet) long.

Note that the microphone requires a separate extention cable, since the
mic jack is NOT on the detatchable front panel. The brochure does NOT
show a mic extension in the 3B kit (it does in the other two). Also,
the 7B kit includes an extra 20 feet of power cable.

Front panel removal is super-easy -- just slide a catch, and it pops
off -- no tools.

I'm currently using a 10-meter band dipole as an inverted "V" in
my garage attic about 15 feet off the ground (restrictive covenants!)
I'm considering moving it into my main attic above the second floor,
which would pretty much double its height from the ground. Do you
think this would increase my signal substantially? Granted, many
factors can come into play.

Most would recommend diodes, but another technique is the old mechanical
relay. Teledyne Relays makes some neat "centigrid" RF relays that work up
to 4 GHz (!) with 80-100 dB isolation. They come in
slightly-larger-than-transistor-can packages with leads on 0.1" centers
(will fit standard protoboard hole patterns).

Mini-Circuits advertizes RF switches. For example, GaAs switches
0-2 GHz bandwidth, 30-40db isolation (depending on type, they also
say you can get up to 60db isolation). Doesn't say about power requirements.

Mini-Circuits, 718-934-4500.

I have no experience with them myself.

I would like to dispell a few popular misconceptions here, as speculations seem to getting a little crazy. In order for any form of electromagnetic radiation to cause cancer it would have to trigger a change in your cells DNA. This normally takes the form of some sort of destruction or _mutation_. If the right sequence is changed in the right way, unihibited reproduction and lack of programmed cell lifetime may occur, i.e. cancer.

Now, this can only occur if the radiation you are exposed to is *ionizing* radiation, i.e. finite mass particles (electrons, protons, ions if energetic enough). The most common forms people are exposed to day to day are medical X-rays, and rocks in the soil. Electromagnetic radiation at the frequencies of light or below is *not* ionizing radiation. The coupling between this energy and cell structures in your body cannot be modeled as an interaction between a penetrating high enery particle and the cell. In order for this energy to couple into your body you would need a resonant structure whos size is some multiple or reasonable sub-multiple of the radition wavelength.

What is the wavelength of a 440 Mhz signal? It's roughly 70 cm. What structures inside your body are even 1/4 that size? Your arms and legs. Thats about it. Now, even at this the effect of the coupling will be to cause local heating. The amount of power required to heat these structures up to dangerous levels is certainly not legal for amateur operations. And thats assuming they would resonate. Since they are fairly heterogenious, I rather doubt they would. You may be able to put enough power into a smaller structure like your eyeball that would resonate, but you would need to operate at a wavelength on the order of 2.5 - 5 cm, or about 6 GHz. In order to couple into your DNA you would need wavelengths on the order of molecular sizes. That means particles.

There are molecules in your body that will exhibit vibrational resonance at frequencies in the microwave range. Water is the most common. So, if you operate at say 3-6 GHz and focus enough power into the proper structures in your body, you may cause some local heating. Note that in order to make this work in a microwave oven a fairly powerful magnetron feeds energy into an enclosed resonant cavity to build up the power levels to the required magnitude to cook your food. Note also that all you get is heating. This is unlikely to cause cancer, since to do that you must slightly damage the string without destroying its ability to function in the host cell. Cooking the cell just won't do.

Recently the FDA has responded to widespread fear of health effects due to power line and cellular telephone exposure by starting a rather large study on the biological and health effects of exposure electromagnetic fields. I attended a seminar at the University of Maryland sometime last year where the latest data was discussed. No conclusion was indicated, although they were trying very hard to find _some_ correlation. In some cases the data supported the conclusion that living under power lines *reduced* the likelyhood of

contracting some forms of cancer. This is counterintuitive. What it means is that any correlation is in the noise.

They have also failed on the theoretical and experimental fronts to show any mechanism for the alleged health effects of exposure to these fields, although they have just gotten started. They did show experimentally that exposure to strong magnetic fields caused isolated cells of one type to change shape. The cell would change back to normal when out of the field and no short or long term effects on the cells operation were found. I find this result far less surprising than they did, given that certain animals like birds can sense the earths magnetic field for use as a guidance mechanism. The cell would *have* to respond to a magnetic field in *some* way for birds to accomplish this feat!

So there you have it. Hams are more likely to suffer health effects from exposure to chemicals and smoke in their environment than from the EM radiation they produce, unless perhaps they have a full KW at 3 GHz running into an unmatched antenna taped to the ceiling of their shack. How many of those old WWII oil capacitors we used to play with contained PCB's, do you suppose?

4933. Hummerland SP 600 receiver

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-11 16:50:02 UTC
From: "Colin Schmutter"
Message-ID: <37efnq$92v@chopin.bcit.bc.ca>
Source record: 223592

I have a Hummerland SP 600 receiver that I was thinking of adding a product detector to.

Does anyone know of the best way to do this mod to this type of receiver?

I was hoping not to add any solid state or IC components to the receiver to keep it all tube.

Please EMAIL any replies or suggestions to CSCHMUTTER@BCIT.BC.CA

Thanks

|>
|>

You should look up the discussion of this in "Physics Today" from
July or August 1994. The field strengths from RF even when close to
a high power system are smaller (by several orders of magnitude) than
the fields due to thermal flucuations (short range microscopic ones).
This makes me very suspicous that the epidemiologists have
found a non-causal correlation (not for the first time).
Actually, it's worth looking at how they
controled for activity profiles - unless you are doing manually
powered qrp on a pedal generator you're not getting much physical
activity when qso'ing. Since execise has a reproducable and measurable
effect on disease rates this is probably important. (i can come up
with other rationalizations like solder fumes if pressed).

Message-ID: <phb.781897123@melpar>
Source record: 223593

rdcole@crl.com (Ron Cole) writes:

>As with most FCC Rules the Power measurment is taken at the output of the
>Transmitter. 73.313 states Transmitter Output of 1500w PEP.

In the broadcast service, two rules are (or were) used. In AM
service, the licensed power output is the power present at the antenna
feedpoint and is determined by the direct method; i.e., by measuring
the RMS feedpoint current and calculating IsqR where R is the antenna
radiation resistance in ohms. AM broadcast power is allowed to vary
+5% and -10% from licensed power, and the station license specifies
the exact amount of antenna current which represents each limit. If
for any reason the radiation resistance and/or reactance of the antenna
and ground radial system changes, a new set of antenna current values
must be determined and a new license issued to the station.

In FM service, the licensed power is the ERP of the station
(+5%/-10%) and is calculated by the *indirect* method; i.e., plate
voltage X plate current of the final amplifier, times the efficiency
factor of the transmitter as specified by the manufacturer in the
operating manual, times the gain factor of the antenna. For example,
the FM station where I worked many years ago had an antenna array
with a gain of 2.1 dBi, or a gain factor of 1.62. For 3000 w. ERP,
the actual transmitter output power was 1849.8 watts, so Ep times
Ip times efficiency had to equal that number at nominal output.
Transmission line loss was *NOT* part of the equation (which is why
we used 2.5" Heliax, since we operated at 99.5 MHz and had over 500
feet of transmission line).

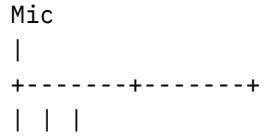
|>use the minimum transmitter power necessary to carry out the desired
|>communications.
|>
|> (b) No station may transmit with a transmitter power exceeding
|>1.5 kW PEP.
|>
|>Looks as if 97.313 (b) says it all.

Says all what? It doesn't say where the power is measured. Clearly it's
not at the exciter. Does it have to be at the output terminal of the
amplifier? You need the definition from 97.3 (b) also:

(6) PEP (peak envelope power). The average power
supplied to the ANTENNA TRANSMISSION LINE by a transmitter during one RF
cycle at the crest of the modulation envelope taken under normal operating
conditions.

[emphasis added by me]

As to my previous suggestion (actually as copied off the contest reflector)
about multiple transmitters/amplifiers/antennas being operated simulateously
to effect a much higher ERP, I'm not sure the definitions cover that. I
can't find anything that indicates that a station can't operate more than
one transmitter at a time (in fact people do it all the time, but usually
on different bands.) So in theory, the following might be allowed if
you could get the phasing correct (no small task).



Xmtr Xmtr Xmtr
| | |
Amp Amp Amp
| | |
Antenna Antenna Antenna

And produce 4500 watts PEP. No transmitter power is greater than 1500W PEP.

Anyone else see something in Part 97 that covers this?

4939. Help! Blown Fuse in TM-742 Control Head

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-11 19:56:40 UTC
From: paul@tc.fluke.COM
Message-ID: <CxIy2n.4yA@tc.fluke.COM>
Source record: 223606

A friend of mine has a problem with his Kenwood TM-742. About six months ago, the radio quit working. The control head wouldn't even light up. We took it apart and discovered that there was a surface mount fuse in the control head that had blown. We installed a replacement fuse and the unit started working again.

This weekend the control head blew another fuse. This would seem to suggest an intermittent short somewhere in the control head. The interesting thing is that another TM-742 owner in this area has experienced this exact same problem. Seems like a rather large coincidence.

So, has anyone out in netland experienced this problem or know anything about it? We will be examining the control head of potential places where an intermittent short might be occurring, but we would be interested in hearing from any other folks that have experienced this problem.

If you do accomplish, I can assure you that the FCC Inspector will
cite you for violating 97.313 (b) by pointing out in no uncertain
terms that any combination of amplifirs such as you propose is, in the
eyes of the FCC, a *single transmitter* and therefore subject to the
1500-watt limitation. The *spirit and intent* of the regulation is
to limit the amount of power transmitted on a single frequency, using
some specific type of modulation (your mike, in this case), by a single
station at a point in time. It matters not how many devices you use,
the *cumulative effect* is what the regulation is all about.

: Anyone have any information on this type of thing?

I would like to correct some of the other statements here (on behalf of my friend), not that he is an expert (self-proclaimed), as you can see from another posting that I have done for him on MODS. But I would like to say on his behalf that the HTX-202 does put out somewhere in the range of 4-5Volts throught the mike jack. This is known from experience as he has made headset with a condenser mike element which needs a voltage as everyone knows and no batteried are needed in-line. A meter was used to find a voltage across the mic leads to be 4.58V. So this project is possible as he is considering making his headset VOX (as of now it is only PTT).

>>>according to Buddy-L documentation.

David,

I think you are talking about regular alkaline batteries and _not_ the
new Renewal batteries, right?

The Buddy-L recharger sells for $20-50 and _claims_ to be able to
recharge _any_ alkaline battery using a patented process involving
special battery monitoring software developed by a professor who was
turned away by all major battery manufacturers.

I've only seen one posting citing specific, controlled experiments
done by the poster, and that experiment found that the Buddy-L did
essentially nothing to improve the lifetime of the alkaline batteries.
The "recharging" done by the Buddy-L had about the same effect as
letting the batteries sit on a shelf for a like amount of time.

I would suspect that long ago the rec.radio.amateur.equipment group
discussed the technical merits of the Buddy-L "recharger". Perhaps
someone could repost their conclusions here (for the more naive
battery users among us).

Thanks,

Mark

Well Dave...I just recieved a brochure from K-40 electronics division
and they have come out with a little device that is retrofitted in a
license plate...they say if you get a ticket by laser then they will
send you a check for DOUBLE the amount...they also state that it is
100% legal in all 50 states...and sugg. retail price is $199.99, kinda
sounds neat-o to get on and figure out how it does it...

4948. Yaesu FT-900 TX Mod

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-12 00:58:30 UTC
From: leigh@coyote.rain.org
Message-ID: <37fcbm$svl@coyote.rain.org>
Source record: 223640

Following is a transmit mod copied from Packet, for the new Yaesu HF rig,
the FT-900. If someone tries it, kindly let me know how it works.

(Also, enjoy the colorful commentary by the original author!)

73; --Leigh/KM6JE in Santa Barbara.

From: KN4IM@N4CII.#CHS.SC.USA.NA
To : MODS@USBBS

For all you MARS operators, the software proceedure for opening up the
new FT-900 for MARS operation is to take off the bottom of the radio,
unplug the infamous blue banded coax cable so you can get the top off.
Take the top off and find two pins TP3001 and TP3002 behind the front
panel on the circuit board that is vertical. Short out these pins ONLY
TEMPORARILY - THE SHORT WILL BE REMOVED SOON! Laying the radio open on
your bench, plug in the power to it. With the power switch off, press
in the 4 left buttons under the display PROC, ATT, IPO NB and hold them
in while turning on the power. The display will read "02 off". Rotate
the VFO knob until the display reads "02 on". Now press the PROC button
to store this new setting and completely reset the processor DESTROYING
ALL YOUR MEMORY SETTINGS. Remove the jumper from the two pins at TP3001.
TURN THE POWER OFF AND REMOVE THE POWER CABLE BEFORE REMOVING THE JUMPER.
Feeding the stupid blue banded coax back thru the frame, re-install the
RF AMP/top cover with the 4 screws. Flip it over and DON'T FORGET TO
RE-INSTALL THE STUPID BLUE BANDED COAX CABLE IN ITS JACK! Re-install the
bottom cover, be careful of all the wad of wires that want to jam
themselves between the frame and cover. Plug in the power and turn the
rig on to see if it survived. Return it to Yaesu, quietly, if it didn't
under warrantee repair. Tune in your favorite CB'er that's been eating
your cheap stripped-down portable TV. Go to CW and now you can jam him!
FCC will be there in the morning, with their new van which was parked
CONVENIENTLY around the corner last night.....(sigh)...

The proceedure is the same for the FT-890 except the jumper is two pads
on the board behind the front panel (JW3001), and the 4 left hand buttons
are labeled PROC,AGC,IPO, ATT you hold down when turning on the power.

No fair jammin me on Channel 19...73, Larry KN4IM@N4CII.#CHS.SC.USA.NA
ANY STUPID MAIL GIVING ME H FOR TELLING THE SECRET IS AUTOMATICALLY DELETED!
ANY HAM STUPID ENOUGH TO DO SOMETHING ILLEGAL DESERVES WHAT HE GETS...
I _D_O_N'T_ WANNA HEAR IT....THANK YOUS CHEERFULLY ACCEPTED, THANKS.

As stated many times before...there are ** ONLY ** two mods
for the HTX-202...
1.) Slide the battery pack off and replace it with an Icom batt.
2.) Remove the supplied rubber duck and add and external antenna!
Other than that there are *** NO *** other mods...If someone sends you a mod
I would *NOT* do it...all it will do is render it useless...try buying an
Icom or a Kenwood radio...they are more "mod-able"...also keep in mind that
even though he may be ABLE to talk there...the radio is NOT "type-accepted"
by the FCC...any other ?'s then persomal E-mail me...

You mentioned having an Icom W2A that you opened up with the
keypad modification. Did you find the receiver has really poor
sensitivity above 455 MHZ? I was playing with one and found it pretty
hot at 455, but almost deaf at 460, which was disappointing. The
signals are there, and with a high gain antenna, I can hear them, but
with the duck, nothing.
Heard on the air that there is a diode modification you can do
to "turn on" the sensitivity at those freqs.

>think this would increase my signal substantially? Granted, many
>factors can come into play.

Hi Ronald,

Since they're both already inside, yes, I think the
added height would help. That's assuming you want
some directivity from the antenna. You're right
however about the added factors. Depending on what's
in and surrounding that part of the attic, things
could get very interesting. But hey, if it isn't as
good for your needs, just move it back! :)

A stronger point though - have you fully explored
all possibilities to get the antenna outside? I've
got nasty covenants too, but I've managed to get
my 20m inverted-vee outside and up about 15 feet.
Not the ideal antenna system, but it gets me across
the U.S. on four watts. Try to get it *outside* if
at all possible.

The trick is it's temporary and low-profile. When
I'm ready to operate, I attach the center to a
pulley system hidden against the side of the house,
raise it up and off I go. When I'm done, I just
lower it and roll it up. Fast and easy. And best
of all, nobody notices. Even if they did, what could
they say? It's very temporary and never up for more
than an hour or two. Even the pickiest person couldn't
claim that would lower property values and all those
other false arguments.

73 de KD6PRD,

-Joe

I'm pretty sure you cant transmit light of the appropriate
frequency/pulse duration or coherency to turn all of the traffic lights
green like emergency vehicles do. Or can you?

: Actually, most of the officers that get this form of cancer are motorcycle
: officers since they must rest their gun near this part of their body
: when chasing a car.
: Also the officers in autos may incidentally rest the gun there if they
: throw it down in a hurry to chase a "speeder".
: It's not done by choice, that's guaranteed...

Did you see the part about the trigger? How do they dose themselves if it is shut off? Also, I would expect that they would have a bracket for such expensive equipment - on a motorcycle. Having been a motorcycle rider in the past, there is no way that I would trust something placed in my lap.

I suspect they will be paying a lot of bucks. One of the reasons for
using laser is that the beam can be focused easily - since it is coherent,
unlike radar. That means that the beam may not even strike the license
plate. The beam could be kept to under a foot in diameter, at the points
where the automobile's distance is determined - without even having to
focus the beam. You cannot detect it, if it isn't there.

4960. Ideas for power distribution system?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-12 06:28:07 UTC
From: finster@zeus.fasttax.com
Message-ID: <finster.343.2E9B81F7@zeus.fasttax.com>
Source record: 223508

I'm setting up a ham shack here in my apartment and I'm looking for suggestions. Currently I'm using (well, listening for now... still checking the mailbox every day for my ticket) a HTX-202 and an Icom 4AT for radios, along with a couple scanners. I have a two large (larger than car battery, about the size of semi-tractor battery) 12 volt gel-cell batteries and want to use them in my power system. (got 'em for free, might as well use em...) My current plan runs something like this:

Hook both gel-cells up in parallel, and trickle charge them from solar cells. Then run the output from the batteries up to a power distribution center (large project box) with a central amp and volt meter on the main line to monitor the battery state. I plan to have 4 or 5 outputs on the project box. The current plan is to use some Radio Shack "universal voltage adapters" to regulate the voltage on the output. I've found the cigarette lighter type at swap meets for a couple bucks each. That way I can switch the voltage between 3, 6, 9, and 12 volts at each output, and toggle the polarity by changing the end plug. I'm not sure how much current draw those adapters will stand, even though they are the "high-power" type, and are vented for cooling.

My thought was by using a system like this, I could kill any AC hum in the system. Also, I could easily stay on the air when the power goes out.

I do have a few questions:

The batteries have no markings at all. All I know is that they are 12 volt, they will take a charge when I charge them up with my 10 amp car battery charger, and they weigh a ton. (ok, about 75 or 80 pounds each.) Any ideas on what sort of current draw they will stand, and what sort of battery life I can expect? These were discarded from a UPS system because they reportedly "wouldn't take a full charge". After charging with my battery charger, they measure right at 12 volts on my dinky voltmeter, under no load.

If I can get a bank of solar cells together that would put out 12+ volts at a trickle charge (100 - 200 milliamp) will I hurt the battery by leaving it hooked up all the time?

Do I need diodes in-line with the solar cells to prevent the batteries from leaking voltage back through the solar cells?

Is my solar-cell idea just a fantasy?

Assuming my solar-cell idea is a fantasy, anyone have useful schematics for a trickle charger I can build pretty cheap?

I thought it would be useful to have the main volt and amp meters switchable so that I could monitor the main line for total current draw and voltage, or monitor each output alone. I think it would be too expensive (though

impressive!) to have seperate meters for the main and all outputs. The problem I see is that switching the meters in and out of circuit would disrupt power to the outputs while switching. Any suggestions to solve this problem?

I plan to place fuses inline with each output. Any suggestions on type of fuses, or are there small circuit breakers that would do the job properly?

Any hidden grounding problems with the above setup that might bite me? I'm currently running from a homemade folded dipole, and a 5/8 wave mag-mount antenna, so the whole setup is floating with no earth ground at all. Should I be concerned with it?

I know someone out there must have a similar setup. Any comments or hindsight observations? I apologise in advance if these seem to be trivial questions and a waste of bandwidth. But then, at least I'm not bitching about for-sale ads and such... :-) I'm not an EE but I'm pretty handy with a soldering iron, at least when dealing with digital systems. I'm learning and reading as much as possible about analog and RF stuff, but I haven't seen this topic covered in the books I have. I've never built a power system before, so any feedback or pointers to other good books would be helpful. I'd far rather buy books and parts and build it myself, even if it ends up costing the same as an "off-the-shelf" system. At least I end up learning something in the process, and know how to fix it when it breaks.

Source record: 223505

Yesterday I bought a brand-new TM-733E to use mainly for 9600 baud packet (JNOS) with a TNC-2H (from Symek - DK9SJ). I am greatly disappointed for the poor response of this radio, just because it has a "dedicated" port for a high-speed modem and this works bad. Watching the electric diagrams of the TM-733 I understand that this latter *can't* work well at 9600 baud...

Any experience by other users ? Any help ?

I am really upset. My FT-736R runs perfect at 9600 and most of the friends operating at 9600 baud using older rigs or simply modified radios have very good performances (at a fraction of cost, compared to the 733).

Don't buy this radio if you plan to use it for high-speed packet !!!

Giovanni Mazzola, IT9XXS.

You'll need the schematic for your Azden I betcha!!!
The 3000 seems to be a workhorse, but the 4000 & 5000 seem to suffer (a lot!) from PLL lock-up. Inside you will find the oscillator circuit in a shiny tin can. It has a bunch of wax in it and the wax seems to eat up the connections within the tin can. If you use a heat lamp and heat the can until the wax softens, dig out as much as possible and then resolder all those contacts you will be good for 4 - 6 months. I got rid of my 4000 & 5000, but the old 3000 serves on packet here. No problems with the 3000 (yet...).

Message-ID: <37h217$n21@kaiwan.kaiwan.com>
Source record: 223622

I have a Yaesu FT5200 dual band radio in my car and have the two speaker jacks connected to individual speakers. That works really great with the audio following what side has what etc...

I have noticed a problem as of late in that while transmitting on one side, the other has a crackling sound as if something was breaking down. This is especially true when I am using high power. The factory told men that it could be spurs occasionally breaking the squelch on the oppsite side. I have tried putting the squelch to max and still have this same thing. Hopefully I will not wait until the rig blows up before really finding the problem.

Question.. Does anybody know or have seen what this problem is?
Is there some component ready to pop?

I would appreciate hearing any suggestions concerning this. Thanks!

Maybe you have a bad mike. My recollection is that the volume control
was the only difference. My SM-34 worked per the manual you mentioned.

Just power up with the mike function key presed, then press the
key you want it to mirror. By the way f and m shifted keys are okay.

4971. "Negative Pulse" Nicad Charger (Mfg. Source ??)

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-12 16:52:09 UTC
From: jcscott@pacbell.com
Message-ID: <37h45a$mg4@gw.PacBell.COM>
Source record: 223623
Cross-posted to: rec.radio.swap,rec.radio.scanner,rec.radio.amateur.equipment,alt.radio.scanner

I am looking for a general purpose nicad battery charger that uses the "negative pulse" concept to recondition and properly charge nicad batteries. Does anyone know of such a device? I have seen nicad battery reconditioner/charges but most of these seem to first discharge and then fully charge a nicad. Maybe one of these will do just as good a job?

Thanks in advance,

Jon

Didn't we just do this last week?? I wish Tandy would add a note about mods
to their docs...

-I have a cop friend with HTX-202 who would like to find mods to make it
-scan out of band into 154/156 Mhz.

There are none. The HTX-202 was designed to only RX in the ham band. That
way, they could put on a very tight front end, and really cut down the
intermod problems. The mod that was floating around a while back was an
April Fool's joke that will destroy your radio if you do it.

You can, however, add a 12V supply and a real antenna to improve your range...

-Would like also mod for xmt in this band on Police Freqs for legal use.

That would not be legal for any ham radio, since it is not type-accepted for
the police bands.

Even if the HTX-202 could be modified to receive and transmit out of band,
which it can't, it would still not be legal for your cop friend to do so.
Ham radios are not FCC type-accepted to transmit outside the ham bands, whether
they can be made to do so or not.

As for a mod for the HTX-202 to work out of band, there is only one mod that
will do it. Take the radio off the Radio Shack battery pack. Get an older
model Icom ham radio. Slide it onto the Radio Shack battery pack. The Icom
radio with the Radio Shack battery pack will now work out of band.

For the humor-impaired among you, yes, I'm being very sarcastic. No mod exists
to make the 202 function outside the ham bands...

Advance Tech in Florida makes/distributes 6 and 7.2V chargers for cellular
phones, which use the negative pulse method. Don't have their address
here, but Hello Direct (1-800-444-3556) sells them.

Source record: 223506

Hello,

I am looking for any information on Nems-Clarke, and Ling Temco Vaught (LTV)
receivers.I have a number (6) of the Nems-Clarke Special Purpose models, and LTV models 187E,188E,188D, and one I forget the m# for.

I have called looking for info on these radios, but not one of the companies is
still around. Nems-Clarke seems to have become Vitro Electronics - which is
nowhere to be found. LTV is just plain dust it seems.

Any pointers would be a big help, these beasties have been
lots of fun, and I would like to find manuals etc. To help
keep them running.

Thanks for you time!

Hello.
I'm looking for equipement to communicate 10 boats on the sea to a base on the coast, i would like to know your opinion about which Equipement buy & use.

First, wich is (Yes! i'm new on the Ham World) the recommended band for marine communications.. I know it is called "Marine VHF".. which Frec. are this ? (MHZ) .
Is posible to use mobile Hand Held radios for MArine Sea to Coast comunication ? How far dows it go ?

I know that Directional Antenna is needed for best Tx/Rx to sea on the base, and Omni-Directional on the boats, could you recommend types/brands..etc ?

I'm looking on the FAQS for this info too.
Thanks to all and
73's from Pedro.
Cuernavaca, Mor. Mexico.

Kenwood TH79 Dual Bander Modification and Feature Guide r1.0 8/21/94
==========
.
.
++++++++++
TH79 Description and Impressions, by Mike Musick, N0QBF
++++++++++
.
.
The more I "explore" this rig, the more I get the impression that
feature selection may be "back to basics". Kenwood might be a
little sore after the TS-50 experience with the FCC and may feel
the need to make access to "tweaks" a little less obvious.
.
.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Can anyone expand on this? Did I miss something about the TS-50?

Thanks

Netters:

My wife and I use our TH77s a lot while bicycling. We use the headset under our helmets, VOX, full-duplex. Annoying feature is that you can't tell when you've keyed the transmitter, since there is no sidetone the way there is on aircraft headset intercoms (and I assume on motorcycle ones) and on telephones (you can hear your own voice in the earpiece).

Anyone know of any HTs with this feature?

R>Path: planet!isdnlin.mtsu.edu!darwin.sura.net!maze.dpo.uab.edu!willis.cis.uab
>From: rbailey@nucleus.com (Rob Bailey)
>Newsgroups: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment
>Subject: RS HTX-202

The HTX-202 has 12 independently-programmable memory channels, plus one calling and three priority channels. It comes with continuous tone squelch encode -AND- decode. Power output is 5 watts minimum (7w typical) with 12 VDC supply, 3 watts @ 9 VDC or 2 watts @ 7.5 VDC. Low power setting provides 1 watt output. A power saver circuit with programmable 1/2, 1/4, 1/8, or 1/16-second duty cycle. Batteries are compatible with larger ICOM (IC-2AT/IC-32AT) series HTs.

Repeater offset can be adjusted from 0 to 4 MHz in steps as set by the scan frequency step selection (5, 10, 20, 25, 50 or 100 KHz). Memories store any offset, and any combination of continuous tone frequencies.

Size is 65 x 117 x 37 mm. To put this in perspective, with alkaline packs on the 202 and my ICOM W2A, both are the same thickness. The 202 is maybe 1/4-inch wider (at widest part), and 1/16-inch taller (it's hard to compare because of the irregular shapes of HTs.) The HTX-202 does give the impression of being a "mid-size" HT until viewed up against something like the little W2A, which actually has three different "widths."

Supplied with Nicad battery, charger, 6-cell alkaline battery case, antenna, wrist strap and belt clip.

Now, the good stuff...

* True FM modulation (not phase modulation) for outstanding transmit audio and best performance in packet service.
* Continuous tone squelch transmit and receive tones are independently programmable.
* In addition to DTMF dialing, there is 5-digit DTMF selective paging (DTMF squelch).
* A five-number memory dialer that stores 15-digit sequences for autopatch use or DTMF paging.
* Scan for either active -- or vacant -- channels, with programmable scanning step of 5, 10, 20, 25, 50 or 100 KHz, and upper and lower scan limits (for VFO scan.)
* FAST, 25 channels/second scanning.
* Selectable priority channel scan interval, every 4, 8, 12 or 16 seconds.

* Multi-function scanning lets you scan standard memories, priority freq. memories, or a frequency range. Resume can be after 10 seconds, when carrier drops, or remain on channel (don't resume.)
* Transmit timeout - if you frequently time-out your local repeater, this circuit will stop transmitting after a preset delay (30, 60 or 120 sec.) and sound a beep. In effect, it forces you to reset the repeater before the repeater times out. Of course you can disable the timeout circuit.
* The HTX-202 carries a 1-year parts and labor warranty.

Subjectively, this HT has exceptionally strong, un-distorted receive audio you'll really appreciate when walking around the local (noisy) hamfest. You won't believe the sound is coming from an HT! Transmit audio is crisp, clear and strong.

I put a 5/8-wave mag mount on my car, and used the 202 in the very intermod-rich downtown Ft. Worth, TX area. I've never been able to use an HT on an outside antenna within 2 miles of down-town Ft. Worth before. This one performed magnificently. My ICOM 2400 dual-band mobile gets less intermod than any other radio I've used in this environment, and the HT stayed with it, toe-to-toe. When the ICOM heard intermod, the 202 heard it, but when the ICOM was quiet, SO WAS THE HT!!!!

Even more impressive, the HTX-202 heard signals through the intermod, when the IC-2400 could not pull 'em out! Reason is probably because we purposely limited coverage to ham band ONLY! It can't be modified for out-of-band receive. The design objective was to build a specialized ham radio product that does the best possible job on the ham bands, and that includes the tightest, most intermod-free front end we could design into an HT! The published spec says intermod attenuation is 60db minimum. Spurious response and adjacent channel rejection are also 60db.

The HTX-202 is based on the ICOM 02AT with certain design modifications based on Tandy's specs. These variations include the encode/decode, additional memories, and a full width LCD display. Contrary to rumor, no part of the radio is Kenwood or Yaesu! ICOM sold the rights to their design to Tandy to do with what they would.

Whan Tandy sought to produce the unit, they went to their usual Korean source for cheap gadgetry: MAXON. Maxon then built the HTX-202 for Tandy, under license from Icom. The HTX-202 is surprisingly sturdy, and well constructed, considering that Maxon's Quality Control has, in the past, been suspect.

>finding the problem.

I have a 5100 (twin brother) the same thing occures to me on certin
frequencies. I find it most when talking on 440 and have the sub-band on
2 mtrs. There's one repeater in particular on my 2 mtr. side that when I
talk on my normal 440 home repeater the radio will pass the audio thru to
the 2 mtr. side and I'll get feedback. On other channels it will work just
fine. I've been told by my friend who works for Yaesu not to worry about it.
If possible use CTCSS decode to keep the sub-band quiet until the correct tone
comes thru opening the squelch.

Earlier this year I called Azden about a mic cable with that weird-ars
connector on one end and stripped leads on the other. Sure, they had a
number of them left that I could use for packet (my specific intention)
but they wanted something like $35 (?) for the cable. Well, since the
radio belong to the club I had to check first before spending that much
for a stinking cable (but with the right connector). "Neah" came the
answer from the powers that be. <sigh>

Nonetheless, the Azden folks do answer their phone and they know that
folks would like to take those old PCS-2000's and use 'em for packet.
If they have any of those cables left, you can get one but you should
give 'em the hand that's missing a finger or two and the leg with the
bum knee. :-)

(bunch of interesting but very speculative comentary deleted)

OK.

1. Most radars in patrol cars are permanently mounted. More so than handheld models. For instance the Iowa State Patrol has both a forward and rear mounted antenna. In the patrol car I drive in NW Iowa, our antenna is mounted on a rotating mount so it swings around, and works just as well as a handheld.

2. Officers place the antenna between their legs, because the are bored and not thinking. The passenger side floor is the best place for it. An officer does not want to have to many obstructions if he needs to get out of the car(or at least try to get out of the car.) I also agree some officers do eat to much junk(donuts) and that is why many die because they were to unhealthy.

3. Laser was invented for the patrol because of two reasons. First, it is tougher to detect because it diffuses very fast and doesn't carry the signature that sets many K or X radar detectors off. Second, it gives a much stronger signal as compared to K or X. With old radar it is very tough to get small vehicles on radar, unless they go very fast.

4. A new brand of Canadian radar now comes with a detector that hunts out jammers. It is available in the U.S. and it does detect laser radar jammers(I have only seen ads). There are also detectors that detect these detectors. Be advised that if you are caught with a jammer not only do you face a stiff state fine but you may be prosectuted under the federal code which is 5 yrs. and $10k. In Iowa it is a simple misdemeanor(30 days and/or $150 fine). I can promise if you are caught by an officer plan on getting a ticket and a possible vehicle inspection and impoundment to determine if there are any other devices in you vehicle(Yes, it is all legal).

5. Do not lay too much faith in all types of radar detectors. An officer does not have to show you his speed he locked you in at but it is a custom. An officer does not have to lock you in on the gun, most do but it is not required by law. If you show 71 then drop to 62, I can still give you a ticket at 71. Radar detectors only protect you because the beam did not directly hit you. It is the radiation on the beam striking various objects that gives you a signal. I will also say no one can beat the radar by slowing down. If an officer wants to stop you he will, do not think it is the radar detector warning you. If I see a radical drop in speed when I turn on the radar, I will stop that vehicle 100% of the time.

6. Police motorcycles also have permanent mounts and the handhelds have a holster on the bike. Most motor officers know better than to place the unit between their legs because it may side out and get caught on the bike or destroy the radar unit and the last thing an officer needs is to get tangled in his radar unit.

I just thought I would give some insight into the radar issue. MPH the largest manufacturer of radar was sued by an officer because of the cancer debate. It was found that there was only a microscopic chance that radar could cause cancer and that his main problem was that he was unhealthy(fat).

4995. How Do I Estimate HF System Requirements???

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-13 07:43:25 UTC
From: Chris Arai <arai@rahul.net>
Message-ID: <CxLpGE.5xL@rahul.net>
Source record: 223526

I posted here awhile back about radios for sail boats. Thanks to those
of you who replied, and if any of you still have opinions I'ld like to
hear them.

Now for the current, related questions.

How do I estimate how far a particular system will DX in the current
minimal sun spot activity? I'm trying to set up a system for DX from
Oakland CA to every where in the Carribean and Latin America.

What bands will work the best?
Will a dipole or random wire work on the land end of the link?
Is an automatic antenna tuner recommended over a manual one?
How much power will be required? (I can't use towers and large antenae.)

Is there a good reference that will help me answer these questions?
Is there a FAQ relevent to these questions?

Thank you.

>coherency. Am I simply misinformed? Or are there other laws in effect here?
>
Regardless of whether it is illegal to transmit light (or whether light
is rf and comes under the FCC) any activity that INTERFERES with a
legal police activity is illegal in most jurisdictions. And no court
is going to allow a defense that relies on our rights to free speech or
that claims that this is a federal premption.

You probably have the right to transmit at any laser frequencies because
the FCC doesn't have jurisdiction at light frequencies although they
have jurisdiction over rf which light is. But you can't interfere with
the police measuring speed limits whether it's your speed or some one
else's. And most legal experts agree that the states can regulate your
rights to monitor the police radar signals. Look at Virginia where
it is illegal to have a radar detector in your car. The courts have
held that this Va law does not violate your federal rights.

>
> Thanks in advance,
>
> Jon

Any conditioning charger will work very well. The discharge circuits bring the battery voltage down to approximatley .6 volt, one should avoid deep discharging the battery to 0 volts, when this happens the battery capacity is drastically reduced (Nicads go through a 'forming' process at the factory and deep discharges undo the benefits of the forming process). I built my own conditioner using hi current silicon diodes to shunt the battery. When the battery low indicator comes up on my scanner I pop the batteries into the discharger to bring everything down to .6 - .7 volts. It won't drop below this because the diode stops conducting below .6 volts. I have noticed a remarkeable improvement in battery capacity between charges and this also eliminates the memory effect (when a cell plateaus at 1v for the duration of its remaining capacity between charges).

Hope this helps.

Andy

From: jms@col.hp.com
Message-ID: <37jge3$j0o@hp-col.col.hp.com>
Source record: 223504

I want to construct a balun, for a receiver, 50 ohms unbalanced
to 200 ohms balanced, covering the frequency range of .5 to 33 MHz.
All the toroid cores I've found (Amidon) don't seem to cover that
wide of a frequency range. Does anyone have any ideas how to go
about such a task? Should I just select the closest toroid core
and accept the losses when I use it out of it's frequency range?

Any suggestion and help are appreciated.

You guys give up too easily. I haven't seen the schematics, but I'll bet
changing the PLL oscillator crystal frequency will change the receive and
transmit frequencies either to below or above the ham band.

From: crossfir@eskimo.com
Message-ID: <CxMBzJ.2J3@eskimo.com>
Source record: 223534

I can't decide between the ICOM T21A or the Kenwood TH22AT for my first radio. I think that they will both do what I need them for (local & repeater), and I would like any responses about them, here or e-mail. One of the questions that I have is I can't find CTCSS anywhere on the Icom, yet it accesses repeaters, and the Kenwood only has encode, do I need decode. The price difference really isn't much to sway my opinion. I just want a quality radio that will still be worthwhile in a few years.

Any responses are _much_ appreciated.

Possibly. The surface-mount nightmare in that box would make it no fun. I doubt that the CPU would have any idea what was happening, tho.

Unfortunately that nice helical filter in the antenna circuit may have a thing or three to do with the problem.

I'll just enjoy the lack of intermod and reliability I am now enjoying, and crank up the scanner if I want to receive out of band. I have no need or interest in transmitting out of band at present.

The HTX-202, bottom line, is not worth the effort to modify--since it works just fine as is. Gad! Did I just say something nice about radio shack?

5005. Q: What's the "best" communications gear for mountain terrain?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-13 17:03:56 UTC
From: bonomo@cxo.mts.dec.com
Message-ID: <37jp9s$453@nntpd2.cxo.dec.com>
Source record: 223514

Greetings, all.

Hope this is an appropriate group for this question.

My two daughters and I need a voice communications link while we are in the Rocky Mountains, in a rather "vertically challenged" area. I think what I want to know is the best frequency range (and manufacturers of said equipment) which will function well in mountainous terrain. I suspect that the lateral range will not exceed five miles, under normal circumstances, but there may be a great deal of rock between us. What is a recommendation from those of you with such experience?

Thanks!

Tom

5006. Yaesu FT-5100 help??

Source record: 223541

I just got a Yaesu FT-5100 rig. Nice radio, but I have a few questions. Is it possible to set up the radio so that audible touch-tone DTMF sounds can come through the speaker when you are using DTMF? I have read the manual and can not figure out how to do that. The only thing I see is a light coming on in the microphone when I use DTMF for each button I push. Am I missing something here? Also, any other key combinations that anyone is aware of that do extra functions? Any info would be greatly appreciated.

Hi Bob,
I would look for a used MFJ-422 Keyer/Bencher Paddle set, or something similar,
at a hamfest. It has a built in monitor that you can use for practice, and it's
a pretty decent keyer for later on, too! They are abt $120 new, so maybe $60
at a hamfest if you're lucky.

Available for adoption is a
Kenwood TS-520SE, 160 - 10 Meter SSB/CW Xcvr. 100+ Watts out from a pair
of 6146B's, Solid state Rcvr, 500 cycle CW filter,
DG-1 Digital display (In need of repair), and VFO-520S
remote VFO. System works OK, I'm upgrading to a
smaller rig for portable work. Built in AC supply.
$350 + UPS charges.

Please E-Mail all replies to Tim.Marek@Megasystem.Com , 73s from NV

5018. FT-990 Opinions and ALC characteristics

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-14 02:55:09 UTC
From: bart@wb6hqk.ampr.org
Message-ID: <Cxn6ry.r9@wb6hqk.ampr.org>
Source record: 223484

I'm considering the replacement of my 15 year old TS-120S five band HF transceiver with something capable of general coverage receiving, the WARC bands, computer control and be practical for the digital modes. Capability for a separate receive antenna and the capability to operate on 12 VDC are also requirements. The Yaesu FT-990 appears to be the lowest price transceiver on the market which meets my requirements. After fiddling around with one for a bit in the local amateur radio store I felt it had pretty good human factors but I wasn't really able to put it through it's paces, especially since I mostly operate 40 and 80 meters and the store didn't even have an antenna for either band!

I would be interested in hearing from anyone who has an opinion relevant to my future acquisition, especially concerning problems, glitches and generally the sort of things you don't find out until you've used the product for a while.

I would also like to know if the ALC input is compatible with my present amplifier which outputs a negative voltage if the peak power exceeds an adjustable threshold. It's compatible with a Kenwood transceiver but i've heard the Yaesu convention is that a positive ALC level from the amplifier reduces exciter output power. It wouldn't be too difficult to modify the amplifier or build an external polarity inverter but I would like to know what i'm up against.

Thanks in advance,

bart wb6hqk

bart@wb6hqk.ampr.org

5019. Re: IC-21A or TH22AT for new HAM?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-14 03:33:35 UTC
From: AE85%NEMOMUS.bitnet@ACADEMIC.NEMOSTATE.EDU
Message-ID: <13OCT94.24364029.0091.MUSIC@NEMOMUS>
Source record: 223462

In response to your inquiry...

I have no experience with the Kenwood TH22AT, but I do own an ICOM IC-T21A. It has been a most enjoyable radio to own. After owning a Alinco DJ180T, the "bells and whistles" of the '21 are much apprec-iated.

The '21 has 100 memory channels (ok, don't flame me if the number is not exactly 100!). The scan rate is VERY fast for a 2m ham radio, actually scans faster than my Bearcat XL100 scanner. It has multiple scan modes allowing you to mask unwanted channels etc. It has CTCSS encode and decode and can scan codes to find the CTCSS tone being used by a station you are listening to. It has bonus 440 band receive which by itself may not be a big selling point (I live in a rural area with no 440 activity), but after doing the extended receive mod, you can receive UHF public service. The actual reception range on mine seems to start around 108 mhz and continues to about 500 mhz. The PLL will actually lock over a range of about 67-999.999 mhz, but I believe no reception is possible except in the range mentioned above (except for the FM radio station 94.5 KRXL which puts out 50,000 watts about 2 miles from my farm).

I have been very pleased with the ICOM. The battery life seems good, and it is compact enough to fit in most any pocket. My only real complaint is that it uses an SMA antenna connector instead of the usual BNC. (I know, SMA is much superior, so what). This is only a problem if you want to do something other than carry the radio in your pocket etc. or if you like to experiment with a variety of aftermarket antennas. If you are lucky, the dealer will throw in the SMA-BNC adapter (otherwise $10), but it still makes life needlessly complicated.

Now, how about the rest of you lurkers getting in here and telling us about your experiences with the Kenwood vs ICOM.

Happy hamming! 73 de WB0RPS

-I'm setting up a ham shack here in my apartment and I'm looking for
-suggestions.
[How to set up a battery power system?]
I will leave the how-to-charge question to someone else, but here are a few ideas...

* Fuse the batteries right at their terminal. We are talking about enough current to melt I-beams here. Fusing at the panel is also good

* I built two boxes for my system - one is just a straight splitter to power the radios (I use their power switches to control them) and one with a switch and LED on each output (for the TNC, CW keyer, filter, etc). You can use binding posts (space them 3/4 inch apart so the double-banana plugs will fit), standard Molex connectors (QST Aug 1993) or DC coax power plugs. It is a good idea to have a few of the 5.5 OD 2.1 ID coax plugs hanging around since so many things use them (HT, counter, SWR analyzer).

* Don't worry too much about those other voltages. Almost everything runs off 12 (13,8) volts. If you need less (and don't mind filtering), I'd use one of the Maxim or Linear Tech switching regulators (or even one of the bricks of a surplus ethernet or analog I/O card)

* Watch out for digital panel meters - they can go crazy with a little RF floating around. I used a standard 15V d'Arsonval (sp?) movement.

* Why not add switching so you can monitor everything (charger output, each battery, main bus). You will need to diode-isolate the batteries with big diodes (look in a RV or marine shop or pull a big bridge rectifier out of something) to let you look at each battery individually. To measure current without interrupting the circuit, pick off the voltage between two points on your positive wire 0.1 ohm (or 0.01 ohm) apart and just multiply the reading by 10 or 100.

* If you were using standard wet cells (which the UPS batteries aren't), wou would have to vent the cells to the outside to dissipate hydrogen forming while charging.

* Use thick wires - check an auto sound dealer/installer. This may be one of the reasonable uses for monster cable. Make sure it is color coded (use red nail polish to mark the positive)

Good luck with the project.
/mike

>You guys give up too easily. I haven't seen the schematics, but I'll bet
>changing the PLL oscillator crystal frequency will change the receive and
>transmit frequencies either to below or above the ham band.

Yeah, but that is *such* an extreme way to do it. The channel spacing
would also change, proportional to the change in crystal frequency.

The PLL used in the HTX-202 is the well documented Motorola MC145170. If
you interrupt the serial programming path to the chip (i.e. cut
traces), you could feed your own TTL level programming data into the
chip. You could change the channel spacing if you wanted, since that is
a programmable feature of the MC145170. You could also program the
PLL to pretty much any frequency you want, but the VCO may (a) not have a
very wide tuning range and (b) may not tune very well outside the normal
tuning range (i.e. Kvco might change such that the loop damping is poor).

As a general rule, the more limited the tuning range of the VCO, the better
the phase npoise performance, so if I designed a 2m PLL VCO, I'd allow only
the minimum necessary over-range tuning to insure good manufacturability and
temperature tolerance. So, you might have to tweak the VCO to lock out
of range.

The front end tuned circuit also would have to be re-peaked at the
band segment of interest.

This is a lot of work; besides having to build an external programming
device to feed the PLL codes, you'd lose the normal 2m coverage.

From: henryvb@aol.com
Message-ID: <37ldgm$qqp@newsbf01.news.aol.com>
Source record: 223525

My friend owns a 1994 Ford Probe. He just mounted a Larsen 440 glass mount antenna on the rear window and gets HORRIBLE (scratchy) reception and a 3:1 swr. Move the antenna and radio to my car (Escort) and it works fine. Move it back to his car, same problems.

Help, can't get any from Ford or Larsen. Larsen engineer says it should work fine. Ford engineer says "leave me alone." Any ideas?

Ne> Any experience by other users ? Any help ?
Ne> *Don't* buy this radio if you plan to use it for high-speed packet !!!

Ne> Giovanni Mazzola, IT9XXS.

I just make my first 9600 connections a few days ago, using a Kenwood
733 and an Kantronics KPC 9612. While my experience with 9600 is limited,
I did not see any major problems.

One "problem" the radio will have is T/R switching times. I've heard
it takes about 180 milliseconds to switch -- pretty slow by some
9600 network standards. A local PacketCluster backbone uses 50
millisecond switching times, and when I tried to send a file, it would
ACK my packets before my receiver was back on... so my TNC would send
a string of RRs until an ACK from the cluster was delayed enough for me
to hear it... or I ran out of retries.

What specific problems have you (any of you out there) had running the
733 at 9600?

You could try to make the old bi-filar wound pair of air core coils
that make a 4:1 balun which is the least lossy balun that I know of.
Barker & Williamson (B&W) used to sell one of these and I think I
have one somewhere that I picked up at a swap meet. Its kinda big
but looks keen. Construction info is avaliable in the ARRL handbook
or maybe Bill Orr's Radio Handbook.

To quote a friend with the Nick ANIMAL stopy crying and start buying!
Pick yourself up a Motorola VHF radio, and toss it around a bit drop it
from five feet and it will still work... Try that with the Kenwood.
Now back to the point.. Find somebody out in your area that can program
the radio for you, and set it up as you wish... NOW even though you may have
police fire and other freqs. that you are not legal to talk on leave transmit
disabled. This radio will hear better most likely, and can be programmed
with a few of your favorite repeaters, or left for the emergency usage only.

The GP300 VHF 16 channel 15 if you set up for scan..
you can also have it mute the MDC or the brap near the beginning or end
of the transmission. Most of all in the Quake prone Cali, you will not
worry about it when it falls off the shelf... You may even drop it at time
just to watch peoples eyes pop out of their head, even more so when all
they use is the Japanese radios.. I have from four feet or so to concrete,
and then I keyed the repeater I use, the radio still works! The radio with
a charger and battery should run about $300 at a ham fest, and about $500-$600
new...

That is what I would do... besides it is more fun, the radio is plain,
and people are not into picking up a plain looking device and playing with it
after all the cool buttons and the such are missing... UNLESS you get the
radio with the phone pad on it.. But it is still plain when placed
by a Japanese radio..

5034. Question about FM receiver noise

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-14 18:59:28 UTC
From: harris.pander01@ic1d.harris.com
Message-ID: <harris.pander01.9.2E9ED50C@ic1d.harris.com>
Source record: 223495

I have two FM receivers, of different designs, which exhibit similar problems; one does it intermittently, and the other always.

If there's no RF input, the audio is always on (no squelching action). When there is an RF input, the receivers quiet and the audio sounds fine. When the problem is present, no adjustment of the squelch control will activate the squelch. On the intermittent receiver, which happens to be in the car, the noise takes the form of impulse noise whenever the ignition is on.

All this leads me to surmise that there's not enough signal into the discriminators to allow limiting to occur (hence the AM noise in the car), so I should be looking for the cause of low IF signals into the disciminators. Can anybody confirm that discriminators without amplitude-limited input levels produce unsquelchable noise on their outputs? (BTW, both receivers use high-audio-frequency (above 3 kHz) noise-operated squelches.)

You made no sense at all Leif. He never ripped on a Motorola. He just wanted
MODS! Leave him alone. Don't be a a punk looking for a fight.. geezzzzz :)
Steve, N9VBC.
PS> You need extended RX and TX if you are in CAP or Mars, anyhow.
With the new CAP freqs, you need a "Japanese" radio to work both Ham and CAP.
You should know more about the subject....

I missed the question here but...

Right, with the rapid charger *do not* turn on the rig. But with
the wall charger and the cigarette lighter charger - no problem.
The wall charger however only gives you 300ma so you can't transmit.
But the cigarette lighter charger some how manages to give you all
5 watts max! (at least thats what the output meter on the unit says).

Hows does LIDAR calculate speed? I thought Laser Doppler Radar uses DOPPLER
Doesen't the unit have to transmit a burst of light, pick it up on a
photodetector, and calculate the time it took? And then try again calculate the
diffrence.

> The HTX-202 is a solid performer, and does EVERYTHING it
> is advertised to do - and does it well.
>

I think every Radio Shack should have a brightly lit sign over their
HTX-202 display saying "leave the damn things alone...they can't be modified
to do whatever you think they can!"

At a large local hamfest a few months ago I saw no less than four '202s that
someone had tried to modifiy and ruined. Highest dollar was $70, wish I
had bought one since I broke the case on mine later. Three came from
the golden hands of a professional VHF/UHF two-way repairman. He had not
learned from the first botched up mess but had to ruin two more for
newbies before word got around what a farce it was.

When I was on staff at ARRL in the 60's before opening my own amateur
radio store I used to spend a lot of time in the tech department going
through the articles that had been submitted. You would not believe some
of the crap that came in for modifying gear! Now we are talking 1962 era
stuff that was pretty layed back....not high strung like todays gear.

But guys sent in elaborate articles that entailed drilling dozens of
holes in the front and back panels, ripping out the IF strip and putting
in strings of cans from command set receivers (the old Q5er for you OTs
that remember them...they worked outboard fine but inboard?????)....and
each author thought he had the ultimate diagnosis for what he perceived
to be a problem. Our lab in the basement at 38 La Salle had four or five
receivers or transmitters where something halfway promising was
attempted...and failed. Our tech folk like Lou McCoy and Laird Campbell
didn't give up easily. One fellow has a mod to turn the G-76's rather

hair trigger six meter section into a 2 meter rig! I ran a G-76 mobile with a Squalo...now there is a collectors item.....and when it would stay resonant it worked great....but you breath on it and it was pegging the plate meter. Can imagine it on two.

Someday at hamfests you will see piles of '202s dirt cheap...but the trouble is most will all have the same ruined components so even a basketful will not produce a usable xcvr.

> Any responses are _much_ appreciated.
>
> 73
>
> LaCier
> crossfir@eskimo.com
>
I had the same question a few weeks ago. I chose the IC-T21A and
I'm very happy with it's preformance. It has sub tone encode and
a sub tone search mode to scan a repeaters sub tone freq. then it
automatically programs it into memory. The only thing I'm not to
happy with is the ant. it seems a little to fraigle for a hand held.

orion1@iastate.edu (Alex Orion Leu) writes:
:
: 3. Laser was invented for the patrol because of two reasons. First, it is
: tougher to detect because it diffuses very fast and doesn't carry the
: signature that sets many K or X radar detectors off. Second, it gives a
: much stronger signal as compared to K or X. With old radar it is very tough
: to get small vehicles on radar, unless they go very fast.

This whole paragraph is silly. The primary reason for lasar time and distance measuring equipment (there is no such thing as lasar radar - at least, not yet) is that it does NOT diffuse anywhere near as rapidly as radar. That is a characteristic of coherent waves. It can easily be aimed at One target, so there is no confusion over which vehicle is being clocked.

Because the energy density of the signal striking the vehicle is higher, it returns a stronger signal.

The last bit about clocking small vehicles is also false. You can use a handheld radar to clock baseballs - which are a lot smaller and not nearly as good a target as even the smallest motor vehicle.

: 4. A new brand of Canadian radar now comes with a detector that hunts out
: jammers. It is available in the U.S. and it does detect laser radar
: jammers(I have only seen ads). There are also detectors that detect these
: detectors. Be advised that if you are caught with a jammer not only do you
: face a stiff state fine but you may be prosectuted under the federal code
: which is 5 yrs. and $10k. In Iowa it is a simple misdemeanor(30 days and/or
: $150 fine). I can promise if you are caught by an officer plan on getting a
: ticket and a possible vehicle inspection and impoundment to determine if
: there are any other devices in you vehicle(Yes, it is all legal).

This is correct. You can be charged with obstruction of justice, interfering with an officer in the performance of his duties, malicious hindering etc. They do not even have to mess with wimpy jammer laws.

: 6. Police motorcycles also have permanent mounts and the handhelds have a
: holster on the bike. Most motor officers know better than to place the unit
: between their legs because it may side out and get caught on the bike or
: destroy the radar unit and the last thing an officer needs is to get tangled
: in his radar unit.

Or get tangled in the wheels or chain, and cause the officer all sorts of grief. Thanks for reinforcing my point.

That is exactly how it works. However, the distance measuring is so precise,
that the two measurements can be made within fractions of a second of each
other.

In article <CtyICs.KMD@vectorbd.com>, grsk@vectorbd.com (Gary Skuse) writes:

Hello, I just went through the same process you are trying to go through. I ended up buying the icom 820. The reason I went with this radio was several. I liked that the icom has the ability to run 12 volts on the coax for powering mast mounted pre amps. the yaesu has that capability also but not the kenwood. That just means you have to run a 12 volt line to the mast. They all have advantages and disadvantages to each other. The icom has fixed outputs, Low and High..This might be a problem when selecting amplifiers because you cant adjust the uhf low side on the icom. Both other models have adjustble outputs. I heard yaesu is coming out with a new radio to replace the 736. I don't know how accurate the rumor of a new radio is. The icom has dual display the yaesu doesnt. Both kenwood and yaesu have the abiltiy to run a third band. The icom is dual banded. But I was planing on running mast mounted transverters anyway. The reason for that is line loss only. If I use a mast mounted transverter I don't have to run hardline for 1.2 or 2.3 mhz..The icom and kenwood both need power supllies. The yaesue just plugs into 110 volts. The icom is the smallest and it fits into my shack just right. Forget the brand name get what fits into your long range plans as far as satellite use or just ssb or cw on 2 and 432 mhz. The icom has pl boards installed the kenwood is a option. I don't know abt the yaesu.

Well I just rattled on with a few things that came to mind. Good luck in your decision...Doug

5061. Re: Question about FM receiver noise

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-16 12:53:46 UTC
From: parnass@nwsf.ih.att.com
Message-ID: <CxrntM.E8@nntpa.cb.att.com>
Source record: 223433

The squelch gate transistor, which is supposed to cut off
the audio, could be defective. Some receivers have an IC
which contains most of the squelch circuitry.

Another possibility is a loss of gain the IF which is
not allowing enough "noise" to flow through to the noise
detector.

I have repaired FM receivers with these defects, and
almost always use a 'scope to probe the noise amp, noise
detector, and squelch gate.

>I was set on buying a new TS-50 for mobile operation and then I saw the
>ads for the FT-900 now I am decided what would be the best choice.
>

I've had both. My opinion is that if you have the mounting opportunities for TS-50
do that. If you have nowhere to put a 50 do the 900. The 50 is a nioce very small radio.
I had no way of mounting it in the new car, and the 900 worked fine for me. The 900
has an annoying problem with birdies(strong and wide) every 50 khz or so, mostly
noticed above 30 meters. When operated without the remote kit/cable it is clean.

From: atla0001@gold.tc.umn.edu
Message-ID: <Cxs4H2.6pF@news.cis.umn.edu>
Source record: 223431

The out of band receive mod has been completed by the previous owner
(cutting the three diodes on the back of the front panel).

The radio also transmits out of band (I am also assuming this was
performed by the previous owner).

I am unable to get the radio to go into cross band repeat by pressing
BAND+SET.

I have tried resetting the CPU. Any ideas?

From: joen9yjz@aol.com
Message-ID: <37s4cg$l3p@newsbf01.news.aol.com>
Source record: 223472

While yes, I do agree with the fact that transmitting infared light
is not illegal, it certainly could be illegal in the effect in which you
choose to use it. A laser gun could be used to change traffic lights that
use the OptiCon system, or, yes, jam the police laser guns. The K-40 Corp.
seems to think that their little laser jammer is perfectly -legal-, and
now this conference has brought me to wonder, how and why?

Well, I bought a DJ-560 (the predecessor to the 580) and when I got it, the DC in jack was cold-soldered onto the PC board, rendering it loose and intermittant in operation. I re-soldered it and all was well, I did put some CyA (superglue) on it to prevent it from recurring. 2 years of heavy-duty use, no problems... I just didn't like the fact that it CAME like that. Oh well.

5076. help with DX-390

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-17 01:35:37 UTC
From: finster@zeus.fasttax.com
Message-ID: <finster.361.2EA1D4E9@zeus.fasttax.com>
Source record: 223432

I know the Realistic DX-390 is not a transceiver so this might be the wrong newsgroup, but I'm trying to monitor the ham bands with it so....

The problem I'm having is receiving anything in the low wave and short wave sections. It is excellent in the MW (Broadcast AM) and Broadcast FM bands - Far better than the little AM/FM radio I have sitting next to it. In the 150-450 Khz and 1.7 - 30 Mhz bands I get nothing. At first I thought my problem was the antenna, so I rigged a long-wire up and plugged it into the external antenna jack. The broadcast AM reception went up a lot, about 5 S-units for some really weak AM stations. The LW and SW bands were not helped at all.

Last night I picked a religious SW broadcast that originates from Dallas (where I live) thinking that because it is local it would have the strongest signal. I tuned to the freq. listed in my SW guide, cranked up the RF gain to max, cranked the volume to max, and switched the BFO off. I could hear the broadcast faintly beneath about 90% white noise. If I backed the RF gain off even a hair, they would fade beneath the noise. I tried tuning up and down in 1Khz steps to see if the radio was off-frequency, but no luck. The broadcast was also fading in and out, sometimes vanishing completely, but never better than 80% noise. This is a local transmitter about 5 miles from my house, and I doubt that propagation is the problem. In any case, this weak signal is the ONLY thing I've ever heard in the shortwave bands at all. I can't hear any of the WWV transmissions, I hear nothing in the ham bands, squat.

I'm really bummed. I have a $10 Jap SW radio that really stinks, but it will at least pick up something even though it has severly limited coverage and overly wide bandwidth. It doesn't cover the Ham bands, so I bought the DX-390 to listen to some code practice and such.

If I knew where to start looking for the problem, I might be able to fix it. I've already opened it up, and didn't see anything burnt, and all the electrolytic caps looked ok. At least no bulging tops on the caps or anything. Anyone have any clues? Anyone have a full-coverage SW receiver they want to sell cheap? (I paid $25 bucks for this one, used.)

The W21AT is an excellent unit for 2m/70cm work. It comes with
all the bells and whistles you're likely to ever want. It does not
have terrific wideband receive on the UHF side, but it performs well
from 430-455 or so. I particularly like the battery life on that
model.
I would only consider the W21AT which is much easier to work
with than the w21A. Keypad entry is highly desirable.
Don't overlook the Kenwood Th79A which has a lot of nice
features too. 73 Dave AA5NU

From: r.rohart@mhsg.cec.BE
Message-ID: <"941017130107a.RE:.AT-18.handheld.power.problem*.I=r.S=rohart.OU=MHSG.PRMD=CEC.ADMD=RTT.C=BE."@MHS>
Source record: 223492

I am the owner of a AT-18 handheld (ADI) which has three power output levels:
low (350mW), medium (2.5W) and high (5W).
For the high power of 5 W a 12V battery or power supply is mandatory.
My problem is that even with a 12 V battery or a 13.8 V power supply my set is
not producing it's 5 W. As a matter of fact, indepently of the setting for medium/
high power, the power output remains in both cases the same (2.5W), when measured wit
h a Wattmeter.

Is there anyone having the same problem? Can someone give my a hint?
Am I to suppose that the handheld is faulty?

It appears there was a reason you were able to buy it so cheap. :-)

From the fact that turning the RF gain back slightly makes a strong
local signal disappear in the noise, it would seem that you're either
suffering from a very high internal noise source, or the input circuit
for HF is fried. It's probably the latter. Look at the circuit diagram
(if you didn't get the book with it, Radio Shack national parts has
it), and see what parts of the circuit are *not* common with the
AM and FM broadcast sections of the radio, then start your checking
there. You may have a fried RF amp or fried bandswitching diodes.
The latter is most likely.

Gary

>
> Output power is 10 watts :-(
> (seems kind of puny these days)

I called some vendors but the rig is not yet available. No one even
knew what it would cost.

The reason this and some other (yaesu) 6M rigs are 10 watts is that
a 10 watt integrated power module is all that is available for this band.
Sure you could build a discreet final module but that would cost much
more.

: :
: : ALSO I thought the radar used in metropolitan areas were at least 25 WATT.

: No way. They are under 1 watt - with a horn antenna that amplifies the
: signal (by making it much more directive) by about 100 times. I seem to
: recall that they were around 100 mw - which would mean the effective
: radiated power would be about 10 watts - at the mouth of the horn.

This isn't right. The mouth of the horn is too close for the
gain to fully develop--you are still in the near field region.
Otherwise, you could run into the paradox of two horn antennas
being close together, and getting more energy out of the
antennas than you put in.

One of the curious things about really big dishes is that you
can reduce the field strength away from the dish by making it
bigger! Imagine a huge dish 1 mile across, perfectly built.
You will get a tremendous amount of gain at X band, but you
have to go so far away to see it that the field strenth isn't
really that strong. Not surprisingly, you can stand anywhere on
the surface of the dish and the field will be pretty weak.

Where is the most dangerous spot on the big dish?

At the feed--but the feed is really a little antenna without
much gain. Thus, you should really worry about stuff like
open waveguide and tiny antennas more than big horns or dishes
at microwaves.

5089. Help: How to use a Kenwood TM-201B?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-17 14:55:49 UTC
From: riyadth@boi.hp.com
Message-ID: <Cxto52.7ur@boi.hp.com>
Source record: 223300

Hello,

I just purchased a Kenwood TM-201B 2m FM mobile at an auction, and am in need of documentation (or at least a little help in using it). The radio seems to work fine, both on receive and transmit. I am able to program the memories (5 + 1 'COM' (what does that mean?)), but it seems that only the 'COM' memory will hold the repeater offset, the rest all seem to require the mechanical offset switch to be used in conjunction with the memory button.

There is a button marked 'AL' that illuminates an LED labeled 'Alert'. What does that do?

I could not find any way to program a PL tone encoder, but I haven't opened the unit yet, either. What should I look for?

As I intend to use the radio for packet, I am in need of a microphone connector. It is a 7 or 8 pin (from memory) connector. Is there a good source for these? Also, there is a 'Remote' connector on the side of the radio that looks something like a mini-din connector. Could this be used as a packet interface, or is it just for a remote control head?

Any help or pointers would be greatly appreciated. I would of course be willing to reimburse any user or service manual photocopy/mailing costs. Thank you.

I am seeking a service manual, or at least a schematic and theory of operation for a Novatel 8305 cell phone. These are little black boxes, measuring about 7" X 6" X 2" (18 x 16 x 5) and have heatsink grooves in the top.

I picked up a few at Dayton this year and am finally ready to get these converted to 900MHz. I feel these beasts would make excellent data radios or such.

Of course, reasonable costs for copying and shipping, etc will be paid.

Also, if you have a bunch of these laying around and want to unload them, lets talk.

>the
>: diffrence.

What the object with the largest cross-section for light on a car?

Experiment: tonight stand 30 yards away from your car and shine a
flashlight at it. What reflects the most light?

The license plate, because its covered with a paint the reflects light back
to the point of origin.

I suspect the "jammer" is nothing more than a device (a plastic license
plate cover) which reduces the reflectivity of the license plate in the IR
whilst not affecting its reflectivity in the visible range (otherwise it
would make the plate illegal). The rest of the fron end should be pretty
stealthy if its shiny and has no reflective parts vertical.

How much refletivity do you get from the hedlights?

If you live in a "single plate state" leave your front plate off.

Better still keep below the speed limit. A pedestrian/auto accident at
20mph kills very rarely but push the speed up to 30mph and the death rate
climbs. Why? you increased the kinetic energy of the car by 2.25 times!

I think we've finally left the realm of ham radio.

>: Why the eagerness to extend TX and RX beyond the range covered by your
>: licence?

I too only want extended RX. This is my first radio. I don't have any
extra money to buy an extra scanner nor do I want to carry around two
rigs. Yet I do want to do what many hams enjoy doing - look for new and
interesting signals. VHF/UHF is where a lot of action is now days.
Why manufacturers don't give us full RX out of the box is beyond me.

>: As far as Tx is concerned, it is very risky as if your radio
>: got stolen or lost, someone picking it up could cause chaos by
>: possibly transmitting out of band.

Very true, but imho, ext. RX is worth the risk. However I am not
oblivious to the risk and treat it a good bit more preciously
than if it was normal.

>: Then there is also the worry of
>: someone picking up the radio and playing with it when you are not
>: around.

Or me simply picking the thing up after listening to restricted TX
bands and accidentally pressing PTT. Perhaps you believe we don't
think of these things or have little sense of responsibility?
To guard against this I typically keep all TX disabled. I figure
enabling TX is complicated enough to keep most busy until I can
recover the rig. This keeps the curious off the ham bands too -
something we can all appriciate.

5108. FT-470 mod questions...

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-18 05:08:31 UTC
From: justinb@psg.com
Message-ID: <1994Oct18.050831.7604@psg.com>
Source record: 223306

I recently purchased the Yaesu FT-470. And I noticed that there is a nice mod for this rig. It has to do with setting a series of jumpers, to produce an other set of freqs. For example the radio itself can tx/rx in the following bands:

2m , 220mhz , 440mhz , 1.2ghz , and some other wierd ones?

What my question is, has anyone ever successfully completed this mod?
And if so how does this radio now perform? Is there any side effects?
Does it actually lock on the freq. on the display or just say it does?

Do you suggest this mod???

The file also said that it would be possible to put a DIP switch on the side of the rig. Has any one done this? The file said that you can just hold down some keys and then flip to a combo of switches and you'd get your preffered freq. I guess to sum it up, I am skeptical about doing this mod.

I have a friend that runs a 220 repeater and I want to be able to get into his repeater without getting a new radio. Please let me know if you have any ideas/comments/or suggestions?

Thanks a milion,
Justin B. KC7FFX

For complete details check out Compuserve's HamNet. The essence is, (and it works!):

1.Remove cover
2. Locate L201 near front panel
3. Snip it
4. Cellular scan will be restored!

Not responsible for results, voided warranty, etc. etc. etc.

Have fun!

5111. Ramsey 40 meter for tech???

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-18 06:51:34 UTC
From: greendot@lamar.ColoState.EDU
Message-ID: <37vr9m$17hu@yuma.ACNS.ColoState.EDU>
Source record: 223336

Hello I need a project for my electronics class. I want to build a 40 meter transmitter. The ramsey catalog sells a kit but it say's that it covers 7.040 MHz. It says that the kit is tunnable to approx 7KHz around the XTAL frequency. I have an old Ham book that says i have privilages on 7100-7150 KHz. If my info is correct that would mean that this kit would not work.
Any suggestions?
Thanks Robert

5114. OMNI-V and grounding problem?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-18 13:19:52 UTC
From: ham@wam.umd.edu
Message-ID: <380i1o$6sc@cville-srv.wam.umd.edu>
Source record: 223414
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

First, the background for my story:

Second story ham shack, no cold water pipes, about 20'
to nearest Earth ground, maybe more.

Antenna is a dipole in the attic, just overhead. Don't
worry, I keep to QRP.

Equipment:

Ten Tec 961 power supply, Ten Tec OMNI V, MFJ-949 tuner,
MFJ-931 arti ground with counterpoise wire.

Symptoms:

With radio, power supply, and tuner in use, no ground braid,
touching the front (bare aluminum) of the case causes the
Power output meter (and reflected power AND Ic) to increase.

Transmitting into the dummy load results in no fluctuations
when touching the case.

When the ground braid is hooked up, joining the radio, power
supply, tuner, and arti ground (no counterpoise hooked up yet)
the problem is still present, except that simply touching ANY
portion of the ground braid causes the fluctuation to occur.

Obviously, it's not that any part of the case is floating.

CONTINUING: HOOKED UP THE ARTI GROUND...

Tune for maximum ground current, and when achieved, the
case should be "at relative zero potential." Touching
the case STILL has an effect on the meter. Actual power
output (forward) at the tuner is not affected, although
the rig shows higher forward AND reverse power and a
higher Ic.

If one fiddles with the arti ground capacitance controls,
it can usually be set such that touching the ground system
has little or no effect on the measured quantities, but
this is NOT at maximum ground current (no even close).

Obviously, my body's stray capacitance is changing the
characteristics of the "ground" system. But why would
the meter care? Obviously it would, and the radio's
circuits would "see" something changing and react. Any

guesses what's actually happening here?

Technical replies are welcome, the more the better.

ii'm looking into buy an inexpensive HT. a couple of questions..

what features should i look for?

what models are good (as in they work for the least amount of money) and how much should i expect to pay for them?

what would be the better kind to buy (because i can't afford a dual band) 2m or 70cm?

thanks alot for your responses..

Gee, Marv - That response pointed me directly to the problem. Thanks! I'll be sure to save your name for the next time I have an electronic failure.

Anyone other than Marv have a suggestion? I've heard rumbles from rec-radio.shortwave that this may be a common failure mode for this radio, and that leads me to believe that there may be a common part I need to shotgun. If this is indeed true, I'll gladly shell out another five or ten bucks for the schematics. If anyone knows of a common part that fails in these units, please enlighten me.

5120. Icom 2400A mod. question

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-18 17:05:21 UTC
From: cjl@galaxy.nsc.com
Message-ID: <Cxvosy.7wz@voder.nsc.com>
Source record: 223408

I have a Icom 2400A, which I have done the expanded RF, and
cross-band repeater modifications to. However I am having
a problem with using the cross-band repeater capability of
the radio.

The problem is that the radio is not tramsmitting the PL tone
in the cross-band mode. I was inputting on 2m simplex, and trying
to output to a 440 repeater, but I couldn't raise the repeater.

We listened to my radio's output with another HT, and could not
hear any PL. With the radio in the normal(non cross-band) mode,
we could hear the PL tone.

Has anyone else had any similar problems? Is it a characteristic
of the radio? I'm pretty sure I completed the mods correctly, as
per the modification book 5A.

If anyone has seen something like this, please E-MAIL me.

Thanks,

Chris Little

Yes, Super Morse is a great way to practice receiving, and so is listening to
QSOs and W1AW. I still make tapes of W1AW and listen to them while commuting,
if I don't feel like yacking on UHF.

5124. S.E.M. QRM Eliminator

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-18 18:25:09 UTC
From: MOORE@acc.mcrest.edu
Message-ID: <A50E4277FC@tmu1.mcrest.edu>
Source record: 223412

Does anyone have any experience with the S.E.M. QRM Eliminator, made by S.E.M. on the Isle of Manx, Great Britain? It was reviewed in the 1992-93 edition of Fine Tuning's PROCEEDINGS.

For those who haven't heard of it, this is a product that hooks up between the antenna & the receiver and can be used to reduce either man-made noise or interference from other stations. Actually, you have to hook up two different antennas to the unit, and it uses phasing to reduce or eliminate the interfering signal. According to Bob Eldridge, who wrote the PROCEEDINGS review, it can sometimes totally eliminate an S-9 hash.

Please respond to the address below. I don't always read this group.

5125. Help, IC32AT gone wonky!

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-18 19:44:05 UTC
From: "F. Kevin Feeney" <fkf1@cornell.edu>
Message-ID: <3818i5$c22@newsstand.cit.cornell.edu>
Source record: 223417

I picked up my trusty ICOM IC32AT HT the other day and went to chat on the local repeater and it was not there. Instead, it turned out to be up 15 khz! All the frequencies seem to have moved up 15 khz - i.e 146.970 you have to tune to 146.985. It's as if the display and the PLL has a 15 khz disagreement on where the radio is set. (transmit tracks - the offset is still correct, but from the wrong starting point also) I can use the radio fine if I 'relearn' all the local frequencies, but that hardly seems the answer. It wouldn't seem like too much is damaged since it still functions except for the weird frequency display.

I tried resetting it - but couldn't be sure I have the reset sequence correct. I used holding down the function + A + turn on and it reset the memories and vfo back to 146.010, with 15 khz channel spacing. I've done that several times. Once it seemed to make things normal again for a few moments, but when I put on a new battery pack, the problem came back.

Does this sound familiar to anyone? I don't want to send the radio off for a vacation in sunny bellevue if all I need is a new lithium cell or a different set of keys in the reset sequence.

The radio does have the diodes moved around for the crossband repeat and direct frequency
entry mods if that makes a difference.

It was dropped the other day, so I could feature it intermittantly loosing back up battery or something like that - but it doesn't rattle. :-)

Help!

73 de Kevin, WB2EMS

Get the service manual from RS. There is a FET in the input circuit that is easy to blow out with static electricity, especially if someone hooked up an external antenna to the rig.
Try replacing the FET.

That is the most usual failure mode, other than loose connections internally.

If you plan to connect an external antenna that is subject to high voltages, some have recommended a pair of diodes across the antenna terminals to limit input voltage, as well as the usual lightning precautions.

I have a DX-390, and it is rather sensitive, fairly quiet, and does OK on Single Sideband stuff for a general purpose receiver. You should be able to hear better

with it.

Kenwood TH79 Dual Bander Modification and Feature Guide r1.5 9/13/94
==========

Clayton Wagar, KD4IDN
920 West Crawford Street #7
Dalton, GA 30720

Here is a compiled list of modifications and features I've found for the Kenwood TH79 Dual Band HT.

Thanks to the following for their contributions to this document:
Mike Musick, N0QBF
Cole Cunningham, AA7RD
Duane Voth, KC5BGV
Chuck Scott, N8DNX

Having had many other radios in the past, and certain to have many in the future, I understand the anticipation of Amateur Radio operators to find modifications to their equipment. I started this document because I want to see _quality_ information circulated as quickly as possible, in order to save a lot of time and effort for others.

If you have any other comments, mods, or information you would like to see included in this document in the future, please send them to:
Clayton Wagar KD4IDN

Outstanding questions at the time this document was released:

* Rumor of a keypad modification to the radio for "Wide band" TX, RX. If you know of this mod, please write to me, even if you wish it not to be published. This would save a number of poor radios from useless torture!

73 de Clayton

VIII. Other Stuff

++
I. Disclaimer
++

Well, don't you get sick of this stuff? I know, I know. However, I must say that I cannot and will not be responsible for anything that might happen to your radio, your person, your dog, or other operators you might talk to with your th79. In addition, if you decide that, with your newly modified HT, you just absolutely must cause unlawful interference with another ham or another radio service, I won't pay your NAL. Really.

Oh, and while we're at it... The extended RX/TX modifications may require you to solder or desolder really, really small components. If you want to know how small, look at the tip of an average ball point pen. Smaller than that. It takes about 1/2 of a second to wipe out several components as well as fry the board inside the 79. Please be careful.

++
II. TH79 Description and Impressions, by Mike Musick, N0QBF
++

Lulled by the sexy small size, I succumbed (or, rather, the credit card succumbed) and bought a Kenwood TH-79 dual-band H-T recently. Already owning a TH-78, the comparison comes easy.

SPECS. The TH-79A is a U.S.-spec dual-band transceiver, featuring coverage from 144-148 and 438-450 MHz. Receive coverage is extended on the 2M side from 118 to 174 MHz with AM in the aircraft band; there is no extended UHF coverage without modification. Max power is rated 5W on VHF and 3.5W on UHF with a 12V source; max power with stock 600 mAH nicad pack is 2.5/2.0. There are three power levels for each band - high, low, and extra-low (30mW). There are 80 memory channels, with no evident expansion capability. U.S./Canada version comes with the CTCSS encode/decode option. Going price at a 7/17/94 hamfest was $480.

GENERAL IMPRESSIONS. Tiny, tiny, tiny. Imagine putting a small duckie on the ARRL Repeater Directory - except that the 79 is narrower by about an inch. With the standard battery and not counting the belt clip, the dimensions are roughly 2" wide, 5" tall, and 1" thick. The belt clip adds 3/8" to the thickness; I left it off so it would be pocketable, and, frankly, it fits moderately comfortably in my work slacks' front pockets, which was surprising. It's tiny! (Oh, I said that already.)

The 79's keyboard has larger buttons than it's predecessor (lacks the cover, too) which are much easier to use. Control layout in general is better and even in just a couple of days I appreciated the change. No more ambiguous power switch - it's in the primary band volume knob in a normal OFF/ON/VOL setup. Secondary band

volume control is on the "ring" of the freq/channel encoder knob in a coaxial arrangement.

There are no squelch knobs; it a key+knob function for both bands. Squelch control was, well, interesting. There are only six "settings", with usually only the lowest setting opening the squelch under no signal. Reading between the lines in the manual, apparently the squelch circuit is semi-automatic. I expected some limitations, but had no complaints under actual use - it worked well.

With my expected habit of putting it in my pocket, I like the control lock switch - it's *not* an F-key function, but, rather is a slide switch next to the PTT. No more fumbling around to unlock it. Unfortunately, the lock function does not lock PTT - that has to be disabled with the "Tx Stop" menu setting. I found this out the hard way by putting it in my pocket and inadvertently keying-up a repeater.

The 79 has an alphanumeric display capability of two lines of 10 characters, which is used in several ways. First, there is a "guide" facility, which provides online instruction for most operation features with a scrolling display. Then there is a "menu" function, which provides access to the settings which were normally done with obscure F-key commands in the 78. Setting the various functions is very clear this way. There is also a status review mode, where the more important settings are displayed.

Finally, the alphanumeric display can be set for each programmed channel. Seven characters positions are available, and almost the entire extended ANSI character set - that's right: lower case, symbols, and accented characters - can be used. However, alpha display is mutually exclusive with frequency display. Frequency display mode can be selected in case you forgot what was "underneath" your programmed channel ID.

++
III. MARS/CAP Modification provided by Mike Musick, N0QBF
++

Here is the MARS/CAP modification for the new Kenwood TH-79A dual-band HT. Usual disclaimers about doing mods apply.

1. Remove battery.

2. Open case by first removing 3 screws (#00 Phillips) on back and 1 screw on side hidden underneath the rubber flap covering the DC power jack. Gently pry apart starting at top; BNC connector will move with back, knobs with front.

3. Spread unit out. Wires will "hinge" on the side with the PTT button.

4. Looking on the back of the keypad (front) half, locate green
wire on upper left, just below the CTCSS decoder module.

5. Neatly cut this green wire, and tuck back in so ends won't
touch each other or other components.

6. Reassemble.

Programmed memory will be lost since the CPU will notice the
strap change and reset itself.

End result -

Before: VHF RX - 118.000-173.995 TX - 144.000-147.995
UHF RX - 438.000-449.995 TX - 438.000-449.995

After: VHF RX - 118.000-173.995 TX - 142.000-151.995
UHF RX - 420.000-449.995 TX - 420.000-449.995

Automatic repeater offset and shift selections remain normal.

And this tip comes from Duane Voth, KC5BGV...

"The MARS/CAP mod can be made without opening the entire case up. You
can fairly easily cut the green wire by simply (and carefully) removing
the CTCSS decoder cover and using a small pair of diagonal wire cutters."

++
IV. "Wide Band" Modification, provided by Cole Cunningham, AA7RD
++

Following is a modification for the Kenwood TH-79A Dual Band HT which
opens it up to tuning from 67-174 MHz and 400-511 MHz. Actual receive was
85-135.995 AM and 136-179.995 FM with reasonable (0.5 microvolt
or better) sensitivity at all the points I measured. Transmit was
136-179.995 and 400-511 with power dropping off at the ends but still
usable (about 0.5w on the high scale at the band edges).

As usual, I take no responsibility for the mods, or your use of the unit
after mod. Please exercise good judgement and don't endanger our ham bands
with your irresponsible actions.

The observations noted are all I tried and I have no further data.
This is such a delicate operation that one shot was all I wanted to do,
and when it worked I quit!!!

WARNING-CAUTION-LOOKOUT-ETC!!!
The diodes to be moved are microscopic!! About 1mm long by 0.5mm wide.
This mod should be done by professionals on a closed track only.
Children, do not attempt this at home. Requires extremely small soldering
tools and MUCH skill. I had a professional surface mount facility do mine...

1. Open the unit by removing three screws from the back and one under the
DC power input cover. Carefully separate the front and back pieces.
The two case halves may be disconnected by pulling the wired plug and by
prying the brown latch on the ribbon cable connector up enough to

release it.

2. On the front PC board in the lower right corner as viewed from the rear with the knobs pointing up there are seven spots for diodes in a row, with one diode missing.

```
|
o o o o x o o |
_______________|
2 3 4 5 6 7 8
```

The numbers are D302-D308, left to right, with D306 missing.

3. Remove D304, and D307. Put them away in a safe place (Just in case...)_

4. You should now have:

```
|
o o x o x x o |
_______________|
2 3 4 5 6 7 8
```

5. Reassemble and good Luck.

Enjoy, but don't create problems with the new capability...Wouldn't it be nice if Kenwood would make a RX only mod with these capabilities and we wouldn't have to worry about accidental transmissions where we shouldn't be transmitting. I, for one, don't want or need to TX, just RX...

73, Cole, AA7RD
August 11, 1994

(Note - This mod also adds 2 more menu settings. One of which is an AM/FM demod selector for the 300-400 Mhz band. To access this band, select the VHF band, press F, then press the Low/Hi key. Repeat to return to 144 Mhz. The AM/FM selector will allow you to listen to Military transmissions in the 300Mhz band in either AM or FM.
- Clayton)

++
V. Remote Base Operation with Kenwood 732/733
++

Kenwood has now simplified remote base operation of their mobile rigs with the TH79.

I will not give a step by step on how to control the mobile rigs, since they are different. Hoewever, to really understand this feature, I would first get to know the remote control feature on the mobile very well. This makes the following explanation a little clearer!

To access this feature, hold [PTT] and [MR] while [POWER ON].

The display will indicate -RC-, which I presume means 'Remote Control'.

If you have correctly matched your DTSS codes, frequencies, etc, the dual bander's keypad now becomes a function pad. Pressing certain keys enables or disables functions on the mobile rig by sending the DTMF sequences for you.

Please note that all this fuction does is send the DTMF tones over the air to control your mobile rig. I have not made a list of what each key does, but as the 79 sends the DTMF tones, the display will indicate the function. (i.e. - RPT ON, RPT OFF, TONE ON, TONE OFF, etc.)

73 de Clayton
KD4IDN

And this from Chuck Scott, N8DNX...

"The "RC" function is configured to directly control radios such as the TM-732. In fact, if you look at the layout of the microphone remote commands for the 732 it very closely matches the key assignments for of the "RC" mode. Since I have a TM-732 installed in my car, I had a chance to try this out and it's VERY convenient. Everything from direct frequency entry with the "F" key to enabling X-Band repeat. I'm really surprised they aren't marketing this feature of the radio."

++
VI. Post Modification Spec Sheet, by Clayton Wagar, KD4IDN
++

Here is a small chart showing the measured specifictions of TH79 S/N 60300272 after modification. The measurements were made with an IFR 1200S Service Monitor, on the bench, with a 6V power supply. Your milage may vary - these are just what happened with mine, and I would suspect that most units are pretty similar.

++
VII. Cross Band Repeat, from Chuck Scott, N8DNX
++

The TH-79 does go into X-Band repeat. Press the "F" key then the "MONI"
key to enter repeat mode. Use the same to return to normal. There is a
10 min transmit limit so it's not useable for long duration monitoring of
a continuous transmission. That's understandable in light of the number
of horror stories I've heard of people frying their HT's in repeat mode.

++
VIII. Other Observations, Ramblings, Etc.
++

From Chuck Scott, N8DNX....

"Regarding the lack of a memory Lock Out function, I talked at length
with the Kenwood people. They have been inundated calls about this and
have told me that they are preasuring Japan to come up with a processor
replacement to fix this, perhaps as a retrofit. I encourage any owner of

a TH-79 to write to Kenwood insisting on such a modification at no cost and asking that they be informed when it is available. I think this is justified for several reasons. First, I have been told by another ham that the official brochure indicates that such a feature is included. Second, and more important, it is arguable that the radio is not suited to the application without memory lockout. After all, it's an 80 channel radio. To make effective use of that many channels REQUIRES a channel lockout function. Without effective use of that many channels, the radio is not comparable to the current standard for such a unit.

BTW, close inspection of the RF deck in my radio shows no obvious missing parts. I didn't remove the board to check the other side, but my suspicion is that the 800 MHz parts are installed. I'd be interested in input from others on that. So far I've not discovered how to make it display any 800 MHz frequencies though."

justinb@psg.com (Justin Bousquet) writes:

| 2m , 220mhz , 440mhz , 1.2ghz , and some other wierd ones?
|
| What my question is, has anyone ever successfully completed this mod?
| And if so how does this radio now perform? Is there any side effects?
| Does it actually lock on the freq. on the display or just say it does?

Whilst you can certainly fool the micro-processor into displaying those
bands, it's extremeley unlikely that the RF bits would tune that far...

Remember, if it sounds too good to be true, it probably is.

My father-in-law recently left Alaska and took with him his new Ham
set and left me his other. It includes a Yaesu FT-101-EE, a Heathkit HM-102
SWR, a Murch Electronics UT-2000B tuner and a dummy load, along with a
dipole antennae he used with the set.
I would like any feedback as to some of the goods and bads of this set
up. Is it functional in todays Ham world? I will be taking my first test(s)
in some weeks and am looking for a local "elmer" to help me use this
equipment, but would appreciate any comments. Also, I have seen several
references to the FT-101E, but don't know what the difference between that
and the EE is. Anybody have a clue?

5138. Yaesu mobile dual band 50/40Watt for sale

Newsgroup: rec.radio.amateur.equipment

Hi

I have a Yaesu FT-4700RH dual band, being 144MHz and 440MHz, mobile
unit for sale. It can deliver a maximum of 50Watts on 2 meter and
40Watts on 70 cm. What is unique about it is that the front face
can be remotely placed with the rest of the unit in your trunk for example.
It displays both bands at the same time and has the optional sub-audible
tone encoders/decoders for both bands. The unit it like new with the
protective plastic over the display still. I have barely used it and
has spent most of its life sitting on a shelf unused.

I am asking $800 obo. If this is unreasonable, please mail me with
what you feel is reasonable.

If interested, please mail on contact me for more info.

Thanks

From: wvanho@infinet.com
Message-ID: <382t76$q3i@rigel.infinet.com>
Source record: 223395

Don Moore (MOORE@acc.mcrest.edu) wrote:
: Does anyone have any experience with the S.E.M. QRM Eliminator, made
: by S.E.M. on the Isle of Manx, Great Britain? It was reviewed in the
: 1992-93 edition of Fine Tuning's PROCEEDINGS.

: For those who haven't heard of it, this is a product that hooks up
: between the antenna & the receiver and can be used to reduce either
: man-made noise or interference from other stations. Actually, you
: have to hook up two different antennas to the unit, and it uses
: phasing to reduce or eliminate the interfering signal. According to
: Bob Eldridge, who wrote the PROCEEDINGS review, it can sometimes
: totally eliminate an S-9 hash.

I did not see the PROCEEDINGS review, but this sounds like null steering similar to what was described in the July, 1994 issue of QST. Following is an excerpt from my "QST Digest" for that issue. You can download copies of the digests from the ARRL Bulletin Board and from ftp sites around the world.

(Following contains material the copyright of which is held by the ARRL, publisher of QST magazine)

Title>TA3:The Null Steerer Revisited
Author>Michaels, Charles J. - W7XC
Source>QST Jul 94, pp. 29-33
Abstract>Using phased primary and secondary antennas to null interference during reception.

Digest>Null steering is a method of using a secondary antenna spaced some distance from the main station antenna and combining the signals received from the two phased in such a way as to suppress an interfering signal. The interference can be QRM or broadband noise from different kinds of electrical sources. The technique works best in suppressing interference from local sources. It is less effective on QRM from greater distances. For skywave signals, it is almost entirely ineffective.

Mr. Michaels has developed an effective unit which is compact and easy to build. He finds that it wirjs very well, especially on the 40-, 80-, and 160-meter bands. He reports that he can put a 50-dB. null on a nearby KW CW signal and that his Null Steerer is more valuable than all the QRM and QRN suppressing features of his modern transceiver.

The unit uses internal phasing lines made of coils wound on toroidal forms and resisters, along with an adjustable gain amplifier to balance the amplitude of the cancelling signal.

The author built a 5-band model containing a 5-position, 5-pole rotary switch for band switching. It covers all 9 bands from 160- to 10-meters. The 10-, 12-, 15-, and 17-meter bands are covered by one filter, the next covers 20- and 30-meters, and the other filters cover 40-, 80-, and 160-meters respectively. He also points out that a single band model, simpler and less expensive, can be built.

Schematic diagrams and parts lists are included for the amplifier alone, as well as for the overall system. The amplifier is an untuned, broad band unit using two monolithic microwave integrated circuits (MMICs) that provides a nominal gain of up to 40-dB. A PC-board for the amplifier, only, is available from FAR Circuits, 18N640 Field Court, Dundee, IL 60118-9269 for a price of $5.50, including domestic shipping. Also a PCB template package is available from the ARRL Technical Department Secretary. Ask for the Michaels Null Steerer template.

>
>Is there a way to eliminate that ?

Yep. It's time to round up all the usual suspects. If there's an electric fuel pump, this could be the culprit. The ignition system is a likely suspect. Various sensors may be noise sources. If you have electric cooling fans, they are suspect. And of course if the car has a engine control computer it'll put out spurs too.

The first thing to do is to determine how the noise is getting into the radios. Disconnect the antenna and see if the noise is still there. If it is, it's getting into the radio via the power wiring. A brute force filter on the power leads can help in this case, as can routing the power wiring directly from the battery.

If the noise disappears when the antenna is removed, it's getting in by radiation. This forces you to track down the exact source and suppress it. (That's a good idea with power line noise too, but in that case the brute force filter is often a workaround.)

Assuming you need to suppress the noise source, first you've got to figure out what that source is. The sound of the noise can give you clues. Does it vary with engine speed, or is it constant pitch? Is it a "popping" sound, or is it a "whine"? Answers to these questions can lead you to different areas of the vehicle looking for the source.

You can make a sense loop to hunt the noise. Take a piece of coax, strip back 3 inches of braid, bend the inner conductor into a loop and solder it to the remaining braid. Now hook the other end to your radio and go poking around with the loop looking for the offending signal.

Depending on the source of the noise, there are a whole range of techniques for suppressing the noise at the source. Chokes, bypass capacitors, and shielding are all ways of dealing with different kinds of noise sources. You should also pay attention to bonding body panels together. In today's vehicles, they are painted before assembly. That means most panels don't have good electrical connections with each other. Copper straps can be

used to bond panels together. That's especially important
around hinges for hood, trunk, doors, etc.

Ok, as you know, both Icom and Yaesu use the "leaky PTT" method of keying the radio. There is a difference, however. Icom uses a 10k leak resistance while Yaesu uses a 2.2k leak. So Yaesu radios won't key reliably with Icom speaker mikes unless you change the leak resistor to a 2.2k value. In the reverse case, Yaesu accessories will work on the Icom, but mike audio may be a bit low from the extra loading. You can just turn the mike gain up a bit to deal with that.

Hmmm... I don't think you understand. I would never dig into my $500
handie-talkie and remove an ASIC "just to see what happens"... but
removing straps that are obviously configuration jumpers qualifies as "tinkering" and I
don't think is *stupid* . Have a nice day.

Be sure to look into the ALINCO models. I am really pleased with my
DJ-F1T (2m only). Rugged, easily mod for extended rcv and/or xmit,
40 memories, DTMF keypad, tiny. Best audio in a tiny HT. They also
have cheaper 2m models, too.

The Radio Shack HTX-202 may still be on sale. Many people like this,
you get a lot for the money.

A newcomer to the HT field showed up at the Boxboro MA ARRL Hamfest,
"Electro-Automatic" of Lawrence, Massachsetts (sorry no phone number
handy, call dir assist for 508 area code). They are marketing some
nice looking low priced models made by some factory in Taiwan that
they insist has lotsa experience making electronix for portable
computer companies.

> either one that can give their opinions of them. I would appreciate it.

I have the TH-78E. Very similar to the TH-78A and it works fine. I did
get molto intermod on 2m in New York City and would appreciate the addition
of a Tone-Search facility. I added the extra memory, which helps if you use
character display ID (useful to remember what channel is which repeater,
but which facility itself halves the number of memories), and also a
speaker mike, 'cause the heat sink is the set back and that gets REAL hot
when transmitting on 12v, such as when mobile.

Good luck with your buy. I'm sure they are both fine sets.

(and the same goes for your separate posting to rec.radio.amateur.misc).

> Output power is 10 watts :-(
> (seems kind of puny these days)

I called some vendors but the rig is not yet available. No one even
knew what it would cost.

The reason this and some other (yaesu) 6M rigs are 10 watts is that
a 10 watt integrated power module is all that is available for this band.
Sure you could build a discreet final module but that would cost much
more.

From: r.rohart@mhsg.cec.BE
Subject: AT-18 handheld power problem

I am the owner of a AT-18 handheld (ADI) which has three power output levels:
low (350mW), medium (2.5W) and high (5W).
For the high power of 5 W a 12V battery or power supply is mandatory.
My problem is that even with a 12 V battery or a 13.8 V power supply my set is
not producing it's 5 W. As a matter of fact, indepently of the setting for
medium/
high power, the power output remains in both cases the same (2.5W), when
measured wit
h a Wattmeter.

Is there anyone having the same problem? Can someone give my a hint?
Am I to suppose that the handheld is faulty?

From: riyadth@boi.hp.com (Riyadth Al-Kazily)
Subject: Help: How to use a Kenwood TM-201B?

Hello,

I just purchased a Kenwood TM-201B 2m FM mobile at an auction, and am
in need of documentation (or at least a little help in using it). The
radio seems to work fine, both on receive and transmit. I am able to
program the memories (5 + 1 'COM' (what does that mean?)), but it seems
that only the 'COM' memory will hold the repeater offset, the rest all
seem to require the mechanical offset switch to be used in conjunction
with the memory button.

There is a button marked 'AL' that illuminates an LED labeled 'Alert'.
What does that do?

I could not find any way to program a PL tone encoder, but I haven't
opened the unit yet, either. What should I look for?

As I intend to use the radio for packet, I am in need of a microphone
connector. It is a 7 or 8 pin (from memory) connector. Is there a good
source for these? Also, there is a 'Remote' connector on the side of the
radio that looks something like a mini-din connector. Could this be used
as a packet interface, or is it just for a remote control head?

Any help or pointers would be greatly appreciated. I would of course
be willing to reimburse any user or service manual photocopy/mailing costs.
Thank you.

It appears there was a reason you were able to buy it so cheap. :-)

From the fact that turning the RF gain back slightly makes a strong
local signal disappear in the noise, it would seem that you're either
suffering from a very high internal noise source, or the input circuit
for HF is fried. It's probably the latter. Look at the circuit diagram
(if you didn't get the book with it, Radio Shack national parts has
it), and see what parts of the circuit are *not* common with the
AM and FM broadcast sections of the radio, then start your checking
there. You may have a fried RF amp or fried bandswitching diodes.
The latter is most likely.

Gary

And the price range is?

I've been recently intrigued by ISA plugin PC RF spectrum analyzer
card. The glossy doesn't say anything about a Windows interface but
it ought to have one... Anyway it's the 9052 Spectrum Analyzer from
Instrument Engines (214)-661-0300 and it's good for 10KHz to 1.6GHz.
Seems to be about 9 kilobucks.

From: ka1kjz@tigger.jvnc.NET (Ronald C. Barnes)
Subject: WANTED: Novatel Service Manual

I am seeking a service manual, or at least a schematic and theory of operation
for a Novatel 8305 cell phone. These are little black boxes, measuring about
7" X 6" X 2" (18 x 16 x 5) and have heatsink grooves in the top.

I picked up a few at Dayton this year and am finally ready to get these
converted to 900MHz. I feel these beasts would make excellent data radios or
such.

Of course, reasonable costs for copying and shipping, etc will be
paid.

Also, if you have a bunch of these laying around and want to unload them, lets
talk.

: : ALSO I thought the radar used in metropolitan areas were at least 25 WATT.

: No way. They are under 1 watt - with a horn antenna that amplifies the
: signal (by making it much more directive) by about 100 times. I seem to
: recall that they were around 100 mw - which would mean the effective

: radiated power would be about 10 watts - at the mouth of the horn.

This isn't right. The mouth of the horn is too close for the
gain to fully develop--you are still in the near field region.
Otherwise, you could run into the paradox of two horn antennas
being close together, and getting more energy out of the
antennas than you put in.

One of the curious things about really big dishes is that you
can reduce the field strength away from the dish by making it
bigger! Imagine a huge dish 1 mile across, perfectly built.
You will get a tremendous amount of gain at X band, but you
have to go so far away to see it that the field strenth isn't
really that strong. Not surprisingly, you can stand anywhere on
the surface of the dish and the field will be pretty weak.

Where is the most dangerous spot on the big dish?

At the feed--but the feed is really a little antenna without
much gain. Thus, you should really worry about stuff like
open waveguide and tiny antennas more than big horns or dishes
at microwaves.

What the object with the largest cross-section for light on a car?

Experiment: tonight stand 30 yards away from your car and shine a
flashlight at it. What reflects the most light?

The license plate, because its covered with a paint the reflects light back
to the point of origin.

I suspect the "jammer" is nothing more than a device (a plastic license
plate cover) which reduces the reflectivity of the license plate in the IR
whilst not affecting its reflectivity in the visible range (otherwise it
would make the plate illegal). The rest of the fron end should be pretty
stealthy if its shiny and has no reflective parts vertical.

How much refletivity do you get from the hedlights?

If you live in a "single plate state" leave your front plate off.

Better still keep below the speed limit. A pedestrian/auto accident at
20mph kills very rarely but push the speed up to 30mph and the death rate
climbs. Why? you increased the kinetic energy of the car by 2.25 times!

I think we've finally left the realm of ham radio.

>: licence?

I too only want extended RX. This is my first radio. I don't have any
extra money to buy an extra scanner nor do I want to carry around two
rigs. Yet I do want to do what many hams enjoy doing - look for new and
interesting signals. VHF/UHF is where a lot of action is now days.
Why manufacturers don't give us full RX out of the box is beyond me.

>: As far as Tx is concerned, it is very risky as if your radio
>: got stolen or lost, someone picking it up could cause chaos by
>: possibly transmitting out of band.

Very true, but imho, ext. RX is worth the risk. However I am not
oblivious to the risk and treat it a good bit more preciously
than if it was normal.

>: Then there is also the worry of
>: someone picking up the radio and playing with it when you are not
>: around.

Or me simply picking the thing up after listening to restricted TX
bands and accidentally pressing PTT. Perhaps you believe we don't
think of these things or have little sense of responsibility?
To guard against this I typically keep all TX disabled. I figure
enabling TX is complicated enough to keep most busy until I can
recover the rig. This keeps the curious off the ham bands too -
something we can all appriciate.

5150. advice on HTs again..

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-19 16:14:33 UTC
From: lees@andrews.edu
Message-ID: <383gl9$9pa@orion.cc.andrews.edu>
Source record: 223359

hi!

i posted about single band HTs a while back and i'd like t thank all the great people who helped me out and answered my questions.

after reading the responses i figured out htat i guess i can splurge and get a dual band and be able to do both 70cm and 2m stuff...

so the same questions..

what are the best (that are afforddable)

what features are useful

how much should i expect to pay.. new and used?

thanks alot everyone!!

steve

5151. mods for Yeasu FT-11R

--> KHz. If my info is correct that would mean that this kit would not work.
--> Any suggestions?
--> Thanks Robert
--> (KB0PED)
-->)

Actually the Ramsey kit is not crystal controlled. It covers the entire 40m band plus a little extra around the edges. The receiver sells for $29.95, the transmitter is $29.95 and the amplifier is $49.95. The rig has about 1 watt out, the amp boosts it to 20w. The prices are the same for 20m, 30m, and 80m kits also.

My company Radio Devices sells Ramsey Kits for 10% less than those list prices + $5.00 for shipping anywhere in the US. Reply for more info or for ordering information. Radio Devices is an authorized distributor for Ramsey.

If you wish, you can call Ramsey at (716) 924-4560 for tech info also.

Steve C. Lee (lees@andrews.edu) wrote:

: what features should i look for?

If you're going to use repeaters (probably) you'll want PL encode,
and preferably decode as well. A reasonable level of transmit power
wouldn't be a bad idea. Wideband coverage is nice, but it invites more
interference, so decide which is more important.

: what models are good (as in they work for the least amount of money) and
: how much should i expect to pay for them?

I'm happy with my Radio Shack 2m HT, and you'll probably see a
nice multi-part ad posted for it in the next day or so. In brief, if
you're looking for a good, sturdy 2m HT, and don't care about extended
receive or transmit, it's a good bet.

: what would be the better kind to buy (because i can't afford a dual
: band) 2m or 70cm?

There seems to be more activity on 2m than on 70cm.

Ne> I have an opportunity to buy a used IC-2410H dual band mobile at what
Ne> appears to be a good price. I'd appreciate hearing from anyone with
Ne> first hand experience with one.

Ne> 73, Jim WB1B

I've had a 2410H for about 2 years now, and I generally like it very
much.

On the plus side, the receiver is more intermod-proof than several other
radios I've used here (Alinco 590, Kenwood 733), even though it's a wide
coverage receiver with good sensitivity over a wide range (including
800 MHz). It has a built-in duplexer, which is a plus if you're
planning on using a dual-band antenna, but a minus if you're not.

On the minus side, the origial microphone supplied yields low, tinny
audio. My dealer gave me a new, different mic (an HM14).

On the so-so side, the buttons are a little on the small side, and
they're not lighted, so night operation is hard. It's more or less
complex, like most radios these days. Probably no worse than others
(fewer features than my new Kenwood 733, and easier to use). I've had
to replace the pilot lights, but it wasn't too tough, and cheap replace-
ments were available at Radio Shack. The "push-button" squelch seemed
strange at first, but I've gotten used to it, and kind of prefer it now.

I guess I wouldn't get rid of mine cheap, especially because of the good
receiver.

Good luck, 73,
Gary KN4AQ, Raleigh NC

Sure. EXCEPT ... isn't it the case that when 50MHz is open, your output power
merely governs how long you have to wait in line? And when it isn't open, you
probably can't afford the electricity to generate your own troposcatter?

The FT-101EE is a fine radio. I used one for years. It doesn't have
micro processors, and multiple vfo's (but real hams don't need those). If
you want to work the world, this radio will do it. It sounds to me like
you've got a good radio for hamming.

As I recall, the difference between the E and EE models was that the E
model had an audio speech processor.

: (via w5yi) Is this the end of "yellow sheets"? Anyone
: else seen this Trader and like/dislike it??

Yep. With three licences in the house, we've gotten quite a few issues :-)
In general I like it. For those of you who are pilots/aircraft owners,
it's put out by the same folks who do Trade-A-Plane, the bible of buying
and selling aircraft. These folks have been doing this sort of thing
for a long time. It's organized in a similar manner to TAP, with a *LOT*
of commercial ads, and the classifieds organized by brand and type of
radio (Drake HF for sale, Drake HF wanted, Drake VHF/UHF for sale,
wanted etc).

The organization is, I think, its greatest strength and advantage over
the Ham Trader Yellow Sheets. It's much bigger than the Yellow Sheets,
but that's mostly due to the wealth of commercial ads. The classified
section seems to have about the same number of listings, but having them
categorized sure helps you to narrow in on what you're looking for.

I don't remember the subscription costs, but I don't think they were too
bad.

I currently subscribe to the Yellow Sheets. I may add the trader and
decide which I like best long term. I've no idea how much duplication
there is.

Kenwood TH79 Dual Bander Modification and Feature Guide r1.5 9/13/94
==========
Clayton Wagar, KD4IDN
920 West Crawford Street #7
Dalton, GA 30720

Here is a compiled list of modifications and features I've found for the
Kenwood TH79 Dual Band HT.

Thanks to the following for their contributions to this document:
Mike Musick, N0QBF
Cole Cunningham, AA7RD
Duane Voth, KC5BGV
Chuck Scott, N8DNX

Having had many other radios in the past, and certain to have many in
the future, I understand the anticipation of Amateur Radio operators to
find modifications to their equipment. I started this document because I
want to see _quality_ information circulated as quickly as possible, in
order to save a lot of time and effort for others.

If you have any other comments, mods, or information you would like to see
included in this document in the future, please send them to:
Clayton Wagar KD4IDN

Outstanding questions at the time this document was released:

* Rumor of a keypad modification to the radio for "Wide band" TX, RX. If you
know of this mod, please write to me, even if you wish it not to be
published. This would save a number of poor radios from useless torture!

73 de Clayton
KD4IDN

++
I. Disclaimer
++

Well, don't you get sick of this stuff? I know, I know. However, I must say that I cannot and will not be responsible for anything that might happen to your radio, your person, your dog, or other operators you might talk to with your th79. In addition, if you decide that, with your newly modified HT, you just absolutely must cause unlawful interference with another ham or another radio service, I won't pay your NAL. Really.

Oh, and while we're at it... The extended RX/TX modifications may require you to solder or desolder really, really small components. If you want to know how small, look at the tip of an average ball point pen. Smaller than that. It takes about 1/2 of a second to wipe out several components as well as fry the board inside the 79. Please be careful.

++
II. TH79 Description and Impressions, by Mike Musick, N0QBF
++

Lulled by the sexy small size, I succumbed (or, rather, the credit card succumbed) and bought a Kenwood TH-79 dual-band H-T recently. Already owning a TH-78, the comparison comes easy.

SPECS. The TH-79A is a U.S.-spec dual-band transceiver, featuring coverage from 144-148 and 438-450 MHz. Receive coverage is extended on the 2M side from 118 to 174 MHz with AM in the aircraft band; there is no extended UHF coverage without modification. Max power is rated 5W on VHF and 3.5W on UHF with a 12V source; max power with stock 600 mAH nicad pack is 2.5/2.0. There are three power levels for each band - high, low, and extra-low (30mW). There are 80 memory channels, with no evident expansion capability. U.S./Canada version comes with the CTCSS encode/decode option. Going price at a 7/17/94 hamfest was $480.

GENERAL IMPRESSIONS. Tiny, tiny, tiny. Imagine putting a small duckie on the ARRL Repeater Directory - except that the 79 is narrower by about an inch. With the standard battery and not counting the belt clip, the dimensions are roughly 2" wide, 5" tall, and 1" thick. The belt clip adds 3/8" to the thickness; I left it off so it would be pocketable, and, frankly, it fits moderately comfortably in my work slacks' front pockets, which was surprising. It's tiny! (Oh, I said that already.)

The 79's keyboard has larger buttons than it's predecessor (lacks the cover, too) which are much easier to use. Control layout in general is better and even in just a couple of days I appreciated the change. No more ambiguous power switch - it's in the primary

band volume knob in a normal OFF/ON/VOL setup. Secondary band volume control is on the "ring" of the freq/channel encoder knob in a coaxial arrangement.

There are no squelch knobs; it a key+knob function for both bands. Squelch control was, well, interesting. There are only six "settings", with usually only the lowest setting opening the squelch under no signal. Reading between the lines in the manual, apparently the squelch circuit is semi-automatic. I expected some limitations, but had no complaints under actual use - it worked well.

With my expected habit of putting it in my pocket, I like the control lock switch - it's *not* an F-key function, but, rather is a slide switch next to the PTT. No more fumbling around to unlock it. Unfortunately, the lock function does not lock PTT - that has to be disabled with the "Tx Stop" menu setting. I found this out the hard way by putting it in my pocket and inadvertently keying-up a repeater.

The 79 has an alphanumeric display capability of two lines of 10 characters, which is used in several ways. First, there is a "guide" facility, which provides online instruction for most operation features with a scrolling display. Then there is a "menu" function, which provides access to the settings which were normally done with obscure F-key commands in the 78. Setting the various functions is very clear this way. There is also a status review mode, where the more important settings are displayed.

Finally, the alphanumeric display can be set for each programmed channel. Seven characters positions are available, and almost the entire extended ANSI character set - that's right: lower case, symbols, and accented characters - can be used. However, alpha display is mutually exclusive with frequency display. Frequency display mode can be selected in case you forgot what was "underneath" your programmed channel ID.

++
III. MARS/CAP Modification provided by Mike Musick, N0QBF
++

Here is the MARS/CAP modification for the new Kenwood TH-79A dual-band HT. Usual disclaimers about doing mods apply.

1. Remove battery.

2. Open case by first removing 3 screws (#00 Phillips) on back and 1 screw on side hidden underneath the rubber flap covering the DC power jack. Gently pry apart starting at top; BNC connector will move with back, knobs with front.

3. Spread unit out. Wires will "hinge" on the side with the PTT button.

4. Looking on the back of the keypad (front) half, locate green
wire on upper left, just below the CTCSS decoder module.

5. Neatly cut this green wire, and tuck back in so ends won't
touch each other or other components.

6. Reassemble.

Programmed memory will be lost since the CPU will notice the
strap change and reset itself.

End result -

Before: VHF RX - 118.000-173.995 TX - 144.000-147.995
UHF RX - 438.000-449.995 TX - 438.000-449.995

After: VHF RX - 118.000-173.995 TX - 142.000-151.995
UHF RX - 420.000-449.995 TX - 420.000-449.995

Automatic repeater offset and shift selections remain normal.

And this tip comes from Duane Voth, KC5BGV...

"The MARS/CAP mod can be made without opening the entire case up. You
can fairly easily cut the green wire by simply (and carefully) removing
the CTCSS decoder cover and using a small pair of diagonal wire cutters."

++
IV. "Wide Band" Modification, provided by Cole Cunningham, AA7RD
++

Following is a modification for the Kenwood TH-79A Dual Band HT which
opens it up to tuning from 67-174 MHz and 400-511 MHz. Actual receive was
85-135.995 AM and 136-179.995 FM with reasonable (0.5 microvolt
or better) sensitivity at all the points I measured. Transmit was
136-179.995 and 400-511 with power dropping off at the ends but still
usable (about 0.5w on the high scale at the band edges).

As usual, I take no responsibility for the mods, or your use of the unit
after mod. Please exercise good judgement and don't endanger our ham bands
with your irresponsible actions.

The observations noted are all I tried and I have no further data.
This is such a delicate operation that one shot was all I wanted to do,
and when it worked I quit!!!

WARNING-CAUTION-LOOKOUT-ETC!!!
The diodes to be moved are microscopic!! About 1mm long by 0.5mm wide.
This mod should be done by professionals on a closed track only.
Children, do not attempt this at home. Requires extremely small soldering
tools and MUCH skill. I had a professional surface mount facility do mine...

1. Open the unit by removing three screws from the back and one under the
DC power input cover. Carefully separate the front and back pieces.
The two case halves may be disconnected by pulling the wired plug and by
prying the brown latch on the ribbon cable connector up enough to

release it.

2. On the front PC board in the lower right corner as viewed from the rear with the knobs pointing up there are seven spots for diodes in a row, with one diode missing.

```
|
o o o o x o o |
_______________|
2 3 4 5 6 7 8
```

The numbers are D302-D308, left to right, with D306 missing.

3. Remove D304, and D307. Put them away in a safe place (Just in case...)_

4. You should now have:

```
|
o o x o x x o |
_______________|
2 3 4 5 6 7 8
```

5. Reassemble and good Luck.

Enjoy, but don't create problems with the new capability...Wouldn't it be nice if Kenwood would make a RX only mod with these capabilities and we wouldn't have to worry about accidental transmissions where we shouldn't be transmitting. I, for one, don't want or need to TX, just RX...

73, Cole, AA7RD
August 11, 1994

(Note - This mod also adds 2 more menu settings. One of which is an AM/FM demod selector for the 300-400 Mhz band. To access this band, select the VHF band, press F, then press the Low/Hi key. Repeat to return to 144 Mhz. The AM/FM selector will allow you to listen to Military transmissions in the 300Mhz band in either AM or FM.
- Clayton)

++
V. Remote Base Operation with Kenwood 732/733
++

Kenwood has now simplified remote base operation of their mobile rigs with the TH79.

I will not give a step by step on how to control the mobile rigs, since they are different. Hoewever, to really understand this feature, I would first get to know the remote control feature on the mobile very well. This makes the following explanation a little clearer!

To access this feature, hold [PTT] and [MR] while [POWER ON].

The display will indicate -RC-, which I presume means 'Remote Control'.

If you have correctly matched your DTSS codes, frequencies, etc, the dual bander's keypad now becomes a function pad. Pressing certain keys enables or disables functions on the mobile rig by sending the DTMF sequences for you.

Please note that all this fuction does is send the DTMF tones over the air to control your mobile rig. I have not made a list of what each key does, but as the 79 sends the DTMF tones, the display will indicate the function. (i.e. - RPT ON, RPT OFF, TONE ON, TONE OFF, etc.)

73 de Clayton
KD4IDN

And this from Chuck Scott, N8DNX...

"The "RC" function is configured to directly control radios such as the TM-732. In fact, if you look at the layout of the microphone remote commands for the 732 it very closely matches the key assignments for of the "RC" mode. Since I have a TM-732 installed in my car, I had a chance to try this out and it's VERY convenient. Everything from direct frequency entry with the "F" key to enabling X-Band repeat. I'm really surprised they aren't marketing this feature of the radio."

++
VI. Post Modification Spec Sheet, by Clayton Wagar, KD4IDN
++

Here is a small chart showing the measured specifictions of TH79 S/N 60300272 after modification. The measurements were made with an IFR 1200S Service Monitor, on the bench, with a 6V power supply. Your milage may vary - these are just what happened with mine, and I would suspect that most units are pretty similar.

++
VII. Cross Band Repeat, from Chuck Scott, N8DNX
++

The TH-79 does go into X-Band repeat. Press the "F" key then the "MONI"
key to enter repeat mode. Use the same to return to normal. There is a
10 min transmit limit so it's not useable for long duration monitoring of
a continuous transmission. That's understandable in light of the number
of horror stories I've heard of people frying their HT's in repeat mode.

++
VIII. Other Observations, Ramblings, Etc.
++

From Chuck Scott, N8DNX....

"Regarding the lack of a memory Lock Out function, I talked at length
with the Kenwood people. They have been inundated calls about this and
have told me that they are preasuring Japan to come up with a processor
replacement to fix this, perhaps as a retrofit. I encourage any owner of

a TH-79 to write to Kenwood insisting on such a modification at no cost and asking that they be informed when it is available. I think this is justified for several reasons. First, I have been told by another ham that the official brochure indicates that such a feature is included. Second, and more important, it is arguable that the radio is not suited to the application without memory lockout. After all, it's an 80 channel radio. To make effective use of that many channels REQUIRES a channel lockout function. Without effective use of that many channels, the radio is not comparable to the current standard for such a unit.

BTW, close inspection of the RF deck in my radio shows no obvious missing parts. I didn't remove the board to check the other side, but my suspicion is that the 800 MHz parts are installed. I'd be interested in input from others on that. So far I've not discovered how to make it display any 800 MHz frequencies though."

FOR TRADE, OR ????

One Model 28 ASR Teletype, complete.
Includes spare Model 28 RO less cabinet
i.e. a spare printer mechanism with base.

The 28 ASR has a regular friction feed platen.
The 28 RO is equipped with a pin feed platen,
vertical and horizontal tab kits (was used to print
airline tickets). If you really want it I have the
Teleticketer (tm) control box - essentially a 300 baud
autoanswer modem with answerback and a loop current generator.

This unit has been in storage in the back of my garage for the last
5-6 years when the current owner moved from a house into an
apartment and asked if he could store it in my garage. I believe it
was working at that time. He has since lost interest in it, and told
me to get rid of it. Manuals _might_ be available - if any interest
is shown, I will put the prospective buyer in touch with the current
owner.

One of My Books that are sitting on my book shelf is entitled:
THE LASER DOPPLER TECHNIQUE
I bought it from the M.I.T. Bookstore.

I have a BSEE.

LASER DOPPLER RADAR DOES EXIST! HOW DO YOU THINK YOUR LOCAL TV STATION GETS THOSE NICE WEATHER RADAR MAPS? SOME ARE MICROWAVE BUT SOME ARE LASER DOPPLER! ALSO THE FAA IS LOOKING INTO BUILDING A WINDSHERE DETECTION DEVICE, it uses guess what ..... LASER DOPPLER RADAR. Raytheon may be awarded this project.

LASER RADAR CAN BE EASILY STEALTHED! ANY CAR CAN BE SET UP to absorb the infrared light. or use multi faceted material.

Why do I study up on this? It's my hobby. I built up a 15mw Laser for Cloud writing. It's frequenct is 520nm. Whenever I use it for either cloud writing or just playing around... someone calls in a UFO sighting. 520nm is nice because the ^&%^@# Sodium Lights don't wash it out.

Anyway the LASER Doppler RADAR bok is by Dr. Drain and is abailable in most College bookstores that offer an advanced electronic engineering course.

BTW, the light source does everything the Microwave Doppler does, except with a tigheter resolution.

Gee Som small Radar Ranges are at 10Watts.
I worked with High Speed Lasers that were capapble of 2 Gigabits per second.
The BER Monitor was a hazardous device because of the frequency it operated on!
Also one guy who liked to place the decice close to his lap has died in 91! I left
when he was diagnosed with prostate cancer. I was always carefull, I didn't even let the
the RF cable near me. I also had a shielded work area and I tried to tell
the other engineer about the hazards, he just laughed it off like yourself.
This device was only running in the 500mw range!

Well here it is, the publisher for the Laser Doppler Technique is:

John Wiley & Sons
Offices in New York , Brisbane, & Toronto
(c) 1980 John Wiley & Sons Ltd.
it sells for $59.95 hard copy
It is written by L.E. Drain
he works at the Atomic Energy Research Establishment in Harwell

FYI
Capter 1 Contents:
The Doppler Shift
Optical Beating
The Diffrential Doppler Technique

Chapter 2
Geometrical Optics
Wave Optics
Interference
The Michealson Interferometer
Interference between two reflected beams
The Farby - Perot Interferometer
Diffraction
Diffraction at Focus
Gaussian Beam Optics

Light Detectors for LDA
PhotoMultipliers (Duh)
Derivation of the Doppler Shift
Relativistic Doppler Shift
Alternative Derivation of the Doppler Shift on Scattering
Doppler Shifting by Difraction Gratings
Brownian Movement and the Doppler Shift

If you had college calculas you can understand the theory. It's not a
nontechnical book. With the information provided you can make your own
device (NO SCHEMATICS BUT ENOUGH THEORY SO IT WILL NOT BE A PROBLEM)
And do some math, what is the best frequency of light for this
device... use common sense. Infra Red causes Jitter so... please
Mr. that tells me no such thing as Laser Doppler Radar that NASA allready tested and the
Air F
Air Force allready has... tell me... what's the frequency Kenneth

MAN, I'm not just a hobbyist, It's how I earn a living. Check out the book rt tt sth
aDzleWis a y o

YOU WILL BE FASCINATED AND LEARN SOMETHING AT THE SAME TIME.

New AST PowerExec 3/25SL-C Color Notebook Computer.

Color VGA LCD display
80 MB hard disk
1.44 MB floppy drive
2 PCMCIA slots
386 processor
4MB ram
(ram expandable to 32 MB)
Serial, Parallel, Video and Mouse ports
Socket for Math Coprocessor
NiMH batteries

This machine is new, I bought it for field packet & contest use.
Never got a chance to try it tho, unexpected finiancial problems etc.
It will also work with pc-hffax and pc-swl and baycom.

$1000.00 obo

>guess what ..... LASER DOPPLER RADAR. Raytheon may be awarded this project.

Laser doppler radar *does* exist, and is being used by a few US police departments. (I've handled one of the units used by the Georgia State Patrol.) This is totally different from the old VASCAR time and distance equipment. However, local TV doppler weather radar is *not* laser, it's Ka band equipment manufactured by Harris. (I service this stuff.) The FAA windshear measuring radar is also *not* laser. It's UHF RF at 449.0 MHz (right in the amateur 70 cm band's repeater input segment, not pretty).

The laser speed measuring doppler radar unit I handled has a TV camera sensitive to the IR frequency used by the laser unit as an aiming device. You can clearly see the spot reflected off the car in the viewfinder. The unit is setup so the officer can videotape the bust. The speed reads out in characters keyed into the video picture. If you try to stealth the car, it's obvious in the camera viewfinder, and all the officer has to do is move the point of aim slightly, to a piece of chrome, the windshield, a headlight, a parking light reflector, etc until he sees the spot reflection, then he's got you.

The only way I can see to beat this system is an active IR jammer. It'd have to be really powerful too because even a functioning headlight, which pumps out lots of IR, won't blind the system.

Gary

5178. IC-901 Control Head

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-20 12:41:41 UTC
From: Tony.Komljanec@banyan.dgim.doc.CA
Message-ID: <M1g8+WNbdia@banyan.dgim.doc.ca>
Source record: 223309

SUBJECT: Auxiliary means of controlling an ICOM 901A radio? Honey, my radio lost it's head!

The control head was stolen from my car (nice ornament for the thief) leaving me with the radio body, etc which was trunk mounted. After numerous attempts at purchasing a replacement head, ICOM made it clear that they do not supply replacement control heads, only parts. My insurance company had to purchase a complete new 901.

This has left me an extra radio minus brains, perhaps useful as a repeater FAT or other computerized application, if a suitable interface could be built or bought. Does anyone know of an interface for this radio body? Or actual protocol/commands that can be issued through the unit's RJ-11 type jack or fibre optic interface?

Also, please respond in this open forum, if you feel that you would purchase a replacement newer, better, fully featured, built-in clock, expanded memory (with scan lock-out), dot-matrix display, DTMF remotable control for your Yaesu, Kenwood, Icom, etc, if one was made available? This alone would finally allow the manufacturers to separate the desires of the feature freaks vs. the serious RF enthusiast. Imagine, you could mix or match the quality of the radio's RF performance with the bells and whistles complexity of your choice! Pay as you play.

Source record: 223342

To: HElliott@losat.redstone.army.mil

H> I am considering which 2m/.7m mobile rig to buy. I want one that is
H>remotely controllable via the DTMF pad on my HT. Is there such a beast?
H>Which rigs are capable of doing this? Do any of the rigs have the
H>capability to change frequencies through the DTMF control and provide some
H>kind of audio readback of the frequency entered? Any advice would be
H>appreciated.

ICOM has a few that can do this. One is the 3230, but it I was told it
has been discontinued and a new one released. Same radio, but with more
memory channels. They also have another one that is a better radio, but
can't remember what it's called. Sorry. You can get a voice chip that
will read the frequency out. Great for a remote base. We have 2 back
to back with a controller and solar power, to go up the mnt. but so far,
no luck finding a building.... Untill yesterday :)

Good luck.

Ohad,
Even if you could find one, you wouldn't want use it. Your cellular phone
is low power (<3 watts) to prevent it from interfering with other cells.
(There are some safety considerations of high power microwave as well.)
In fact, each cell actually controls the power output of your phone to one
of 8 levels of power depending on how strong your signal is. This is to
isolate you to only one cell at a time. If you were to increase to say
20 watts you could overlap several cells and seriously confuse the system.
In congested areas, say a city, the cells are very close together and you
are generally running only a few milliwatts of power to prevent you from
"spilling over" to other cells. In rural areas where the cells may be
several miles apart, you may be at full power most of the time. Remember,
these towers may be several hundreds of feet tall so three watts goes a
long way. If you need a better signal I would suggest a better antenna
not more power. You might want to build one yourself. Just center it at
around 835 MHz for your transmit frequency. You don't need to worry too
much about SWR, your phone should handle infinite SWR.

5181. Question: Yaesu FT-11H weird things afoot...

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-20 13:26:40 UTC
From: donovan@lpopsb.mayo.edu
Message-ID: <1994Oct20.082640.1@lpopsb>
Source record: 223334

Hello,

I am wondering if anyone has an Yaesu FT11H and
has noticed a chugging kinda power on/off state.
The situation is power on for about a half second
then display fades for about the same time span
then it goes to the power on state, etc. etc..
I tried the key pad but nothing appeared to
work....I took the battery out a couple times
and then put it in same situation...I think
everyone is saying now that the battery is
just dead...but....I think I should have noticed
the battery low indicator....does the indicator
display a couple seconds before things get messy?
.
I put the battery in the charger and replaced it
after a hour or so just to see if things looked
different, I had it only on for a little bit but
things looked normal...has anyone witnessed this?
is my radio possessed??? if so is it demonic or
friendly :-)....
.
otherwise it seems to be a great little radio...
the battery is the 9.x volt nicad...
.
Does anyone with the 9.x nicad have a idea of the
charge life...I am guessing on a full charge I
had the following useage...

Battery Save mode running..
Scanning 3 hours
Tx (low power) <30 minutes
rx 1 hour

should this be about a charge life.....

My Nokia bag phone is rated at 6 watts. Most of the "mobile" cell phones and some of the handhelds give the full legal limit of six watts according to my local Cellular 1 provider. Most of the handhelds are only 3 watts or less.

: Don Moore
: MOORE@ACC.MCREST.EDU

I sent Don Email but thought I would post this also:

I think a same circuit as the QRM eliminator is in the following book.

Interference Handbook
William I. Orr, W6SAI
Radio Publications, Inc.
ISBN 0-933616-01-5

There is an article about a noise-balancing antenna bridge that seems to be the same device. I borrowed one from a friend and it works fairly well. I live two miles from WWV and use it to reduce the 10 MHz WWV signal when operating on 30 meters. I can reduce WWV about 20db while signals in the 30 meter band don't seem to be affected. I can adjust the unit for ~40db of attenuation on WWV but at that point I get six+db of attenuation on the desired signal. It really helps the receiver overload problem from WWV on 30 meters.

I haven't tried it with line noise yet but the guy who built it didn't seem to have much success with line noise.

I'm not entirely certain the organization is an unqualified advantage;
people often list several unrelated things in one ad (for example, a
Drake and a Ten-Tec), and choose one classification. This might cause
something to be overlooked. I have been searching forever for an ICOM
IC-402 transceiver (hint hint) and I end up reading _all_ of the
classifications searching for one, not just ICOM UHF or ICOM WANTED.

Anyway, I like both, take both, and would run an ad in both if I was going to
advertise.

Hi out there!

1) On my ft-470 there is a hole on the right side. It's closed with a pice of gum. Behind it's prepared for a DC input plug (they told me).

Now: Is someone expieried building such a 12V supply for the ft? Do you have some hints for me?!

2) It's fun to run PR with 1200 baud!
It's much more fun to run PR with 9600 baud !!!

Now: Do's someone know how to run 9600 on the ft?!
Is it possible?

Thanks for your answers in advance!

> Does it actually lock on the freq. on the display or just say it does?

I also have FT-470 and have heard (and done) a modification like this. Only
that it didn't have anything to do with any jumpers, all the actions were
performed by the keypad (for transmitting, fiddling with jumpers might be
necessary - I have only extended the receiver).

>I have a friend that runs a 220 repeater and I want to be able to get into his
>repeater without getting a new radio. Please let me know if you have any
>ideas/comments/or suggestions?

I'm sorry to say this, but no, you can't have the 470 really work on those
bands. You can trick the display to go to just any frequency, but the RF-
part of the 470 can handle only the 2 m and 70 cm HAM-bands. Additionally,
when out-of-band, the sensitivy is reduced quite noticeably. E.g. on
160 MHz you can hear only the strongest signals. On 220 MHz the PLL doesn't
probably even lock.

The modification is only useful, if you want to listen just a little on
the side of the HAM-bands (2m ja 70cm). The usable ranges are about
120-170 MHz and 410-460 MHz.

5189. PRR-15 data needed..

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-20 16:43:39 UTC
From: lakeith@robins.af.mil
Message-ID: <3866nr$c4j@wrdis02.robins.af.mil>
Source record: 223252

OK, hanging around surplus places has finally messed up my mind. I recently purchased a PRR-15 Receiver. This portable unit receives .5 to 30 mc (AM, CW, SSB) and 15 to 205 mc (AM, FM, CW). According to the data plate is was made by Zenith for the USMC. The set includes a power supply that can run the thing from either 115 VAC or 24 VDC along with a battery pack that can accept either C or D cells to produce the required 12 VDC to power the thing. And, there is a tape recorder and a microphone included with it along with a couple of long wire antennas and a couple of whips.

However, despite my best efforts, we have not been able to locate any type of manual for these rigs. I have mine up and running, but I would like to know more about it and have some information if it ever breaks..

If you have any info, an e-mail would be appreciated.

The other thing people have tried is to use a moving reflector.
Doppler systems depend on getting a lock on the frequency difference
between the forward and reflected beam. (you can't directly
count the waves in optical or near optical systems (at least
not recently)). So if you add a strong more or less random
component to the reflected beam you make the lock harder to get.
One of the engineers involved in inverse scattering was having
his students design such reflectors - because the wave length
is small they don't have to be much bigger than say fuzz dice ;-).

After looking at a 757GXII that was for sale, and looking at back issues of QST for review articles, can anyone tell me why the 757 was re-released as the GXII? Was it to fix some kind of bug? Its production run didn't last very long, did it?

It looks and acts like a great radio to have, as far as used equipment goes, but are there problems to be encountered down-the-road?

My coverage of QST is limited, only back to '86, and I wasn't able to find an article on it in any of the end-of-year directories; the adverts don't show many GXII's. Wasn't able to find a review of the 757, either.

Is this a good used radio to buy? Opinions/comments welcomed! Tnx. 73.

OK, here we go. After having one of each to sell, here are the differences:

The '757 came out in 1984. Wildly popular, with very small size, general coverage receiver, AM/FM/SSB/CW and a 600-Hz filter standard, AND an iambic keyer standard! It could be controlled via computer and an interface box.

There were some complaints about it, though. The tuning rate was slow, and there was no "FAST" mode. It had IF shift and IF width, plus an infinite clarifier (RIT) and a Noise Blanker. But it was missing a notch filter. The mode didn't get stored in the memory as it was set via a mechanical switch.

The GX/II came about around 1989. Same "guts" as the 757GX, else they would have renamed it. There was now:

1) A "FAST" button, to achieve a faster tuning rate
2) A "MODE" button which cycled the radio through a series of LED's indicating the mode. The mode was now stored in memory along with the frequency.
3) A Notch Filter. Wow.

The scanning feature was somehow changed, although I don't remember the specifics. Well, that's about it. The case color was changed slightly, and the fluorescent display, once a purplish-blue (very pretty and colorful), was replaced with a gray-blue display (quite drab in comparison).

The radios have the same receiver and transmitter circuitry, save for your standard running changes. The interfaces and bells & whistles changed.

If you do the extended RX mod, the Kenwood will also transmit everywhere.
I wish they had a RX mod only. But, here is a way to keep you from
talking to the local police by mistake.

The 79A allows split transmit on all 80 memories. So on the
scanner frequencies like 460.200 (local poice here)
I set the transmit frequency to a safe simplex frequency or
something in the ham band.

I have all my non-ham RX frequencies matched with ham TX frequencies
just in case.

I have the following for sale:

ICOM 4SAT HT 440-450Mhz 5W
with BP-90 battery pack (Holds 6AA batteries)
BP-84 Battery Pack
Speaker/Mike
Recharger
Leather Cover

Asking $300.00 o.b.o.

I have had a 740 for over 10 years (I think). Bought it new and still like it a lot. I'm not a heavy user, but it meets my needs fine. I have considered a new radio from time to time but always come back to the decision to keep it. The one thing I miss is that it does not have general coverage receive and I would like more memory channels. $525 sounds like the going price, but it depends upon the options installed. Mine has the internal AC supply, FM board, crystal marker, SSB filter and so on and I think it would be worth about $600. It too is in mint condition. No scratches, looks like the day I got it.

>
>Anyway the next time you are in a magnitude 8.0 earthquake and only have
>your HT you might be thinking about extended RX too!

I'm new to this amateur radio, and I'm still in the persuit of my licence
(s'pore licencing isn't exactly the most convinent)

But I was wondering: _IF_ you did such mod to your HT, as well as a extended
TX mod, and in the event of an emergency, it _should_ be ok to xmit on 'out
of band' freqs isn't it? (That is, if it _is_ an emergency).

And having read some other places, I have come across one point, and it was
supposedly an amateur is to be 'prepared'.

So, don't you think you ought to be prepared, and get extended TX too? You
know, just in case...

But is it illegal to own/posess a rig that can get out of band (even though
you don't use it on out of band freqs).

Nothing can ever beat the fustration of being able to
hear them, but not being able to tell them were you might be...

Just my 0.02 worth of thoughts...

5201. HF Rigs

ng about buying an HF Rig that is about 1000-1500 dollars and it should have an Antenna tuner. I was thinking of buying an FT-900 or an FT-890 with atenna tuners. I want the 900 but the detatchable face is said that the radio makes noise when you use it. So the FT-890 would be my choice but I think the FT-890 is going to replace it. Does anybody have any information on it? Victor Morange KE6MWA.

>for 20m, 30m, and 80m kits also.
> ...

I bought the 30M xmtr and rcvr a while back. The xmtr is indeed crystal controlled but has a circuit to 'warp' the crystal to cover a 10-20Khz range. The rcvr is a DC design. I was not impressed by either unit. The designs are bottom line and the performance is about the same. I don't know about the amp. For $45-60 you can buy several much better units. Several QRP clubs offer nice QRP transceivers that will run rings around the Ramsey units, with more power, superhet rcvrs, wider band coverage, QSK, xtal filters, etc. for that price.

My two cents worth...

Take a look at something other than Yaesu; you can buy a ts850s or 440s by Kenwood. If you can find a ts830, go for it. As for Yaesu, look for a 990 as a really good rig.

Hi

With the help of a couple of friendly netters, I was informed that
the original asking price was too high. So, I reduced it to now only
$400 plus shipping. It is a Yaesu FT-4700RH dual band (2 meter and 70 cm)
with max power output of 50W on 2m and 40W on 70cm. It is a remote
head design. Physically it is in perfect condition. It has been
rarely used and subsequently has spent most of its time sitting on a
shelf.

If you would like more info or are interested, please contact me.

Thanks and 73s

Donald North

DG>Any opinions on mobile 2m rigs? I am currently looking at the
DG>Yaesu FT2200 and 2400.

Hello Dave. I am currently using the FT-2400 as a base/packet rig. I've had it since about April of this year (1994). The only problem I have had was lightning damage. It was repaired and seems to operate normaly. The only gripe I have is that I can't turn off the LCD backlight. Kind of spooky to wake up at 4:00am with a glow in the ham shack :)

DG>Also, what about the Yaesu dual banders, the FT5100/5200 ?

I also have a FT-5100 in my pickup. It has been in service for almost two years. No problems at all. The only gripe I have with this rig is the limited number of output power selections. On 2m it is either 5w or 50w, no in between. I also have the MW-1 wireless mike for the 5100. I had to do the mod described in the owners manual to keep the mike from keying down without my pushing the PTT button. I would not recommend the wireless mike unless you drive a straight shift and have problems with the mike cord getting wound around things.
I hope this is some help. 73, Paul KD4MPR

What your salesman/person (whatever) probably meant was 6 watts ERP not
6 watts transmitter power. Most of them have a 3db or 4 db antenna on
them. As far as I am aware, but I could be wrong, 3 watts output is the
limit for the transmitter. One of our local cellular dealers advertised
a mobile/antenna combination with 12 watts output. "...4 times the output
of
regular cellular phones..." What they didn't say was that it was a 3 watt
phone and a 6db gain antenna.

The legal limit for mobile and bag cellular phones is *3 watts*. If your
salesperson told you otherwise, they were just being a salesman, IE they
were *lying*. Handheld units are limited by law to 0.6 watt.

Antenna gain can boost the ERP of either to a higher level, but output
power is Federally regulated.

Tell me about it, it's certainly dangerous to my repeater.

No, these systems do not automatically transmit warnings. That's
a different short range system used on airport property. These
big honkers run megawatts ERP firing straight up from "rural"
sites. They are used to do atmospheric profiles looking for
conditions that promote windshear.

I have a TH-22 and it is the best little HT I have ever had. It's
flat, not rectangular and boxy like the ICOMs, and so fits into the suit
pocket comfortably. Also it has 3, that's 3 watts with regular battery.
Only one thing that it doesn't have is an illuminated keypad. I think
that Kenwood figured that most of us program at home and then operate the
HT with one hand, changing freqs, etc. Also, my brother has a Yaesu HT-11
but that is only 1.5 watts in compact form. They now market it with a 5
watt batt but it is bigger than the TH-22.

Recently picked up a TH 79, which uses the same battery and is almost
as small. I heartily endorse the TH 22 Dave KA7HDN/AE!

Hello Robert!, If you want a dipole, you can make one
by yourself with 14 AWG cable, my forty and twenty meters
antennas are made by myself and works pretty good, or at least
I think so.
Practical Dipole Antenas:
A classic dipole antenna is 1/2 wavelength long and
fed at the center.
How much to prune: when assembling the antenna, cut
the wire 2-3% longer than the calculated length and record
the length. When the antenna is complete, raise it to the working
height and check the SWR at several frequencies. Multiply
the frequency of the SWR minimum by the antenna length
and divide the result by the desired frequency of
operation. The result is the finished length; trim
both ends equally to reach that length and you're done!
This was excerpted from the ARRL Handbook for
RADIO AMATEURS. there is still more to know about the
orientation of the inverted V, but I don't know
if you know it by know, if you want more info, I
could give it to you, but I suggest that you buy the
book, because there's a lot of info very useful.
One cuestion, are you general class or Novice,
by now I dont remember why the 0 in KB0PED.
I hope this info will be useful for you, and
if you are on forty or twenty meters I hope to contact you.

Bob,
I tried to respond directly but your email address came back as
invalid....
You do have a unique situation... One of the main problems that you
will have is that your phone is full duplex. (ie receives and transmits
at the same time about 30 MHz apart.) You would be hard pressed
to find or design a high power amp that would be able to isolate the
receive from the transmit. Just the white noise generated by the amp
would seriously desense your receiver. My suggestion is to build either
a large yagi array (835Mhz or so) or a parabolic dish. A four foot
parabolic
dish should give you 20+db gain. There are distributors that produce
antenna equipment for the 800Mhz bands. You can find them in many
of the commercial trade rags. At one time I worked for one of the local
radio stations (KTSA/KTFM). Our FM transmitter was remote and tied

into the studio with a full duplex 900MHz transceiver that produced
1/4 watts. The antenna was a 2 foot parabolic half-dish.
The transmitter was about 40 miles from the studios so I know
that you should be able to build an antenna for 800MHz that would get
you 70+ miles at 3 watts. Our local PBS station has a similar situation
with a remote transmit site. It uses a 4 foot dish at 7 Gig and 2.5 watts
for a distance of 45 miles.
So, I think that the key is not more power but a better antenna. This would
prevent the full duplex problems of isolation.

Good Luck, 73

If the NiCad is dead because a whisker has shorted out the plates
then you are supposed to be able to revive it by dischaging a cap
through it, by buring out the whisker. However I've had no success
with any NiCads that measured a short, even putting a car battery through
them. Once a NiCad is a couple of years old you may as well kiss them
good bye is my experience.

Ok all you more watts the better people - relax and engage your brains.
I have run 5 watts or less with a 5/8 wave ground plane on 2m with good
results - 40 miles regularly into a decent repeater, and it gets out well
enough for simplex - especially when I use a 5 element beam. As for 6m,
a friend worked New Mexico on < 3W ssb during a band opening. I would
suspect that 10W for 6m FM would be useable for modest local communication
when the band is not open and overkill (sometimes) when it is. Remember
it is easier to increase your range with a good antenna than with a power
amp. QST recently had a really good article about powering your way to an
s-9 signal - it's just not worth it!

Actually, a CNR improvement of 3db can mean a SNR improvement of
10db or more thanks to the FM threshold effect. That can make the
difference between a miserable noisy signal and one that's a pleasure
to copy.

>My Nokia bag phone is rated at 6 watts. Most of the "mobile" cell phones

>and some of the handhelds give the full legal limit of six watts
according
>to my local Cellular 1 provider. Most of the handhelds are only 3 watts
or
>less.

Actually, it's like this:
Power class 0: mobile phones (in vehicles) max power output =3watts.
power class 1: transportable phones (bag phones) max power is 4 dB less =
1.2W.
power class 2: portable phones (handhelds) max power is 8 dB less = 0.6
watts.

All phones are capable of being dynamically powered down by the cellular
system to -28 dB of power class 0 (or 4.75mW)

5231. Kenwood HT 22AT

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-22 17:54:11 UTC
From: lthfbjk@northstar.k12.ak.US
Message-ID: <9410221534.AA28291@northstar.k12.ak.us>
Source record: 223376

I am looking for a 2 meter hand held and have virtually no local stores I can browse in. The unit will be used as a communications device between myself and my wife while riding snowmachines. The Kenwood HT 22AT was recommended as one unit that would be small and to which I could attach a voice activated boom mike and earphones. Does anyone have any comments on such a set up? Does anyone know where I can purchase a voice activated mike that can attach to a snowmobile helmet?
An associated question involves a commercial product called "The Communicator". It is a small radio which attaches to your helmet. It transmits on 900 mHz. Is there any inherent reason why that transmission frequency would make it easier to work a boom mike on a noisy snowmachine, as compared to a 2 meter ham radio? My goal is a rig that will allow me to ride my machine while talking to my wife. I have heard nothing but complaints about the commercial rigs available for this purpose, but have been told one use a 2 meter rig effectively. Now I have to find the best hand held and the appropriate mike/ear plugs. Any comments and sources for hardware would be appreciated. (I take my novice test in two weeks....)

5232. Ten Tec OMNI V/VI owners - HISS problem

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-22 18:37:40 UTC
From: ham@wam.umd.edu
Message-ID: <38bm5k$p3t@cville-srv.wam.umd.edu>
Source record: 223379

To all devotees of the OMNI V/VI series...

Best radio I have ever had the pleasure of listening to. But it's got this really annoying HISS, that's kinda high-pitched, right smack dab in the middle of the audible range that really gets in the way of copying that weak DX.

My IC-735 does it too, and in the same manner, but its tone is lower and deosn't SEEM so invasive. What I've determined:

Bigger signals seem to mask the hiss.

It comes up along with the noise floor when you play with the volume

Reducing the RF gain reduces BOTH noise and the hiss, but the noise and/or signals go down first. With RF gain turned down somewhat, turning the AF gain brings the hiss WAY up above the noise.

The HISS is there even with the absence of a filter (i.e. NO RF signal)

The tone control (AF side) has no effect on the pitch, but accentuates the hiss when turned to the high-frequency end.

The passband tuning controls have no effect on the hiss.

When a signal is present, turning on SLOW AGC doesn't let the hiss pop up until the signal drops.

The hiss is there in all modes at the same volume and pitch.

All recent mods have been done by Ten-Tec. They should have improved the hiss problem somewhat, although I never heard the radio before the mods were done. I just expected the hiss to be DOWN somewhat compared to my Icom.

After the PBT filters, there's a mixer, and then trhee stages of RF amping, mixing for audio, a few AF stages, then out to the speaker.

Is it being generated in the RF amp stages, or in the AF stages?

If the RF stages, what can I really do about it?

John,
I've been working on modifying a 110W Motorola Micor for the
amateur band. It would have been cheaper probably to use a GE, but
the Motorola was really cheap. It has taken alot of work... Modified
the Receiver, including the helical coils, and am presently getting
0.25 microvolt at -12 dB SINAD... Not bad for a radio rated at 0.35
microvolt!
Also modified the Tx exciter only. The PA deck will tune,
but not very well. The whole pursose of this modification is to
replace a tube type Progress Line transmitter, and Mastr Pro Receiver
for the Washington University ARC repeater, W0QEV. The Tx is at 147.885,
so I was able to get the Micor down from the spec'd low of 150.8 MHz, as
it was a police mobile unit, that operated in the 155 MHz range.
As far as books go, I've not seen any, but I did find
Micor mods on the net somewhere. You will need the Micor manual!
I hope to publish my mods someday...
I know that Mitrek's can also be modified for 9600 baud
packet, and can put you in touch with the guy here in St. Louis
that does the mods.

Hello all. I'm looking for some info on a Midland two way radio. It's a business band 460MHz or so unit. It's a model 70-245BMX Land Mobile Radio (LMR). It has 16 channel capability but it seems only one set is installed. When you're on channel one it seems to receive on two (It hits a local repeater and the repeater keys up on the output freq). Channel two is the output frequency and it sends and receives on that channel. All the other channels won't transmit. I looked inside and everything looks synth so I'm not sure how the other channels could be disabled or not installed.

Any information will on this radio will be greatly appreciated.

A friend of mine is looking for hams that are interested in discussing the radio aspect of packet radio. i.e., tx delays, sythesized radio on packet, group delays, etc. He's interested in putting the radio back into packet radio.

If you are interested in the radio side of the hobby and not just BBS forwarding, and running packet dx clusters, bbs, nodes, etc just send him an e-mail or send it to too so I can relay the info.

His packet radio address is VE2BMQ@VE2FKB, his name is Burt. He'S built a digital regen repeater and installed many nodes on 2m and UHF. You can also try ve2bmq%ve2fkb@bbs.ve2ums.ampr.org on the internet.
IF you could also send me a copy in case the other 2 methods don't work.

thanks Dino

5241. Kenwood HT 22AT

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-23 21:12:29 UTC
From: lthfbjk@northstar.k12.ak.US
Message-ID: <9410231852.AA38014@northstar.k12.ak.us>
Source record: 223388

I am considering purchasing a Kenwood HT 22AT for both myself and my wife for use a communications device between snowmachines. I have been told that we would be able to rig up a VOX system and filter out the unwanted snowmobile noise and be able to speak to each other. There are simple headsets (non-2 meter tupes) on the market for such use but nobody I know likes them.
Does anyone have any comments on the Kenwood 22AT or have other recommendations? Does anyone have a good source for them (I cannot purchase any locally). Does anyone have a source for a mics and earphones I can hook up to them, and finally, does anyone know about a mic that is part of an earphone that "hears" you via the bones of your inner ear? I have seen such a unit advertised more than once but don't know how effective it would be. If it worked it would be great because up here where we ride at -30 a mic can tend to freeze over with your breath as it freezes on the mic!
Any comments would be appreciated on helping to set this up.

I cannot get into the usenet portion of the internet so any replies must be posted here or be sent to me via e-mail lthfbjk@northstar.k12.ak.us

44 foot hot galvinized steel tubing telescoping mast. can be adjusted in length from 10' to 44'. has 5 sections, each segment has hand clamp and attachment points for 4 guy wires. base segment is 2.25"od top segment is 1.25"od. each segment has provisions for being pinned at max extension.

this is a heavy unit so shipping is likely going to be expensive.
delivery possible in Texas.

5243. Info on NiMH batteries wanted...

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-23 23:37:47 UTC
From: bad1679@ultb.isc.rit.edu
Message-ID: <1994Oct23.233747.10584@ultb.isc.rit.edu>
Source record: 223392

Hi All,

I would like to add a rechargeable battery to the inside of my A&A QRP rig and replace the insert of my Kenwood PB-21 pack with new batteries. I would like to try using Nickel Metal Hydrite (sp?) or rechargeable Lithium batteries instead of NiCad's because of their higher energy density. However, I have been unable to find a source of either Nickel Metal Hydrite or rechargeable Lithium batteries.

Does anyone know of a company that will sell either Nickel Metal Hydrite or rechargeable Lithium batteries?

If so, please send me their address and/or phone number..

THanks...

Bernie Doehner nu1s/9

5244. KENWOOD 733A MODS

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-23 23:58:07 UTC
From: keith.knipschild@asb.com
Message-ID: <9410232358.A3050wk@asb.com>
Source record: 223247

Has anyone found MODS for the Newest DualBander 2/70cM mobile
radio from Kenwood ???

I cut the 2 jumpers behind the display, but all that gave me was:

VHF Rx 118 - 174 Mhz
VHF Tx 142 - 152 Mhz

UHF Tx 420 - 450 Mhz
UHF Rx 410 - ~ 517 Mhz (even though the display says different)

Example ::

To recieve 470.8375 you would set UHF to 353.7875 Mhz.....the
magic Number is 117.0500 Mhz

470.8375 >>>>>>>>>> freq to wanted to listen to
- 117.0500 >>>>>>>>>> magic number

____
353.7885 >>>>>>>>>> Freq to tune to on Kenwood 733

If there are any mods please POST or E-Mail Me ...

Keith

5245. Does ICOM IC-1271A (1.2 GHz) lose RAM?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-24 00:40:19 UTC
From: dgf@netcom.com
Message-ID: <dgfCy5J77.G3L@netcom.com>
Source record: 223393

Some of the ICOM VHF/UHF base multimodes have the fine feature of losing
their firmware if you let the CMOS battery discharge completely.
I believe the IC-271A does this.

Does the IC-1271 share this fine quality?

73 Dave WB0GAZ dgf@netcom.com

5246. Icom

Hello, Keith. I decided to post the documentation to the group in
addition to sending it direct to you in case someone else is looking
for the same thing. It's been about a month since the last posting.

You baught a nice rig. Let me know if you find any bugs/problems.

Modifications, Undocumented Features, and Bugs for the Kenwood TM-733A.
Release 2.0 Updated October 1, 1994

Updates for Release 2.0 are identified by parenthetical statements.
There is also some new information sprinkled throughout the previous material
either to update it, to correct misinformation, or to be more specific.

This document is a compilation of Internet messages from
Steve Haehnichen KE6JGK and Brad Killebrew N5LJV, edited by Brad Killebrew.

Extended RF Modifications

Refer to diagram below. (Inserted into Release 2.0)

Remove power source from the radio.

Remove the display panel.

Remove the top cover the radio.

Face the front of the radio away from you.

Remove the speaker.

Looking from the back of the radio, the control board is vertically
mounted just behind the front panel wall (which can be removed easily
if better access is needed.)

Just to the right of a chip labeled XRU4066BCF and just to the left of
two green wires (B2 & B3 which are draped over the board to the rear) are
two zero-ohm SMT resistors, B0 and B1, marked "000".

Remove B0. (the one on the left - furthest from the green wires)

Taking it out might be a bit tricky. It's glued down for surface-mount
assembly. Be careful not to pull the trace from the board.

Perform a CPU reset by holding [MR] while turning on the radio.
It will then ask if it is "OK?" to reset, press [MR] again.

The ranges after modification are as follows:

Tx: 136-174 410-470
Rx: 118-174 300-470

The cellular band is indeed missing.

ONLY Removing Jumper 1 (B2) is the MARS/CAP modification.

** Diagram of specified area on Control Board **

EDGE OF BOARD, viewed from the rear, looking toward front panel

Green jumper wires (B2, B3)

The jumpers are actually soldered on the other side of the board,
but the loops come up over the top and hang over the B0/B1 side.

B0=R414
B1=R412

Here's something interesting! According the Kenwood rep I spoke to,
performing this mod *does not* void your factory warranty. The same
goes for any Kenwood published service bulletin or modification info.
We are encouraged to perform the repairs ourselves to save them the
trouble and expence.

DTMF Remote via Microphone

The TM-733 is fully DTMF remotable via the microphone (documented).
The radio can also be externally DTMF controllable with an HT, but that
will be described later.

The DTMF control keys are exactly as shown on page 81 of the
manual. Note that the microphone is active all the time, so any
ambient DTMF tones near your mic will also change rig settings. This
includes tones coming in on the other band and out the speaker.

Cross Band Repeating

Cross band repeat isn't documented but comes ready from the factory.
To enable cross band repeat from the front panel, first select a band
by pressing BAND SELECT. Then, change the control to the other band by
hitting [CONT SEL]. Next, press [F] for one second, then the "X" button
(far right side). Decimals will appear between the Kilohertz digits, and
the "ON" indicator will light momentarily. The microphone sequence to
enable cross band repeat while in remote control mode is "DC".

The transmitter hang time can be toggled between 500ms to 0ms by
turning on the radio with [LOW] pressed. They also recommend enabling
the Time-out Timer, for obvious reasons.

Note that the TM-733 can also be used as a "one-way" cross-band repeater.
For example, if you can receive a distant repeater with your HT, but have
difficulty getting into it, you can use the TM-733 to boost your transmitted
signal. To set this up, just omit the part where you "change the control
to the other band by pressing [CONT SEL]." Doing this will setup the TM-733
to repeat your signal to the other band, but will not retransmit the distant
station back to you. If this sounds ambiguous, play around with it a little
and it will begin to make sense.

DTMF Paging and Squelch

The DTMF Paging & DTMF Squelch protocol (AAA*BBB) is compatible with
the Yaesu 530 and all Kenwood radios supporting this.

DTMF Monitor

There are some serious bugs in the "DTMF Monitor" feature (Page 63:
[PTT] + [DWN] + Power On). This feature supposedly lets you hear the
DTMF tones you are transmitting. The first problem is that it only
gives you a short tone from the internal speaker. This is not true to
the transmitted tone that lasts as long as you hold the key. The much
bigger problem is that it mixes the desired tone and the feedback tone
resulting in an almost indecodable DTMF tone. Kenwood is aware of this bug.

(Updated information for Release 2.0):

Per Ricardo, a Kenwood technician, they are aware of this bug and are working on a fix. No details yet.

Front Panel

There are two undocumented icons on the display; one is the "heart" symbol. Anyone know what that's for? It could just be a spare. I noticed they used the odd "spade" symbol to indicate AM receive, so maybe these were last minute extras. Dunno..

From looking at the schematic, it seems that the only programmable memory is physically located in the detachable front-panel. I think this means that if I use my front-panel on someone else's radio, I get all my memories and settings. Anyone try this?

The whole front panel is connected to the rig by four wires (yep, including the volume/squelch pots.) According to the schematic, these are: power, ground, data in, and data out. I'm wondering how hard it would be to make a PC interface for this thing and replace the whole display and controls with a full-screen version. It wouldn't surprise me if many of the programming limits were also imposed by the front panel, and not the unit.

Wireless Cloning

The advertised but undocumented Wireless Clone function is described in App Note AAN-0008 which they will mail out on request. (Maybe if enough people ask for it, they will include all the functions in future instruction manuals.) In summary:

- Prepare the two radios for simplex operation on the same frequency.
- Turn both radios off
- Press [CALL]+[SHIFT] + [Pwr On].
- This should place the radios is clone mode with "CLonE" on the display.
- Press PTT on the "Master" radio momentarily. This will start sending the programming DTMF tones.
- After all data has been transferred, the display of all radios will read "End", indicating success.
- If the signal is interrupted or corrupted, the "Slave" displays will read "Err". Turn them off and try again.

Notes:

- Both the Master and Slave radios must have the same number of memory channels available for each band. Example: You can not clone a stock Master to a Slave with ME-1 memory expansion.
- You can not clone between different Kenwood radio models, even if they seem identical.

Be careful when using the clone feature. It has been known to wipe out
or scramble memories on the master radio during or right after clone.

Bugs and Problems

To date, I have logged two trouble reports with Kenwood.

The first is the well-known problem with the transmitted PL (CTCSS) tone.
The tones are filthy. They contain many harmonics and synthesis noise.
I'm guessing this is because they are using 7-bits from the CPU and a
resistor net (DAC) to synthesize the tone. The sound/intensity of the
noise depends on the actual frequency being generated. The PL tones also
come out of the radio's speaker while transmitting. Weird, but not a problem.

The PL noise seems most messed up (on my radio) at 107.2 Hz, where the
noise beats with the tone. Go simplex and ask someone to describe the
noise to you, or listen carefully to your own speaker while
transmitting. Some repeaters do a better job than others of hiding
the noise for you.

(New information inserted into r2.0):

==========
Transmit PL Fix
==========

Kenwood just released a Service Bulletin to address the transmitted PL
tone noise on the TM-733A. (Yeah!!) Call the Kenwood Service
Dept. (1-310-639-7140) if you want a hardcopy. Here's a summary of
the text. Use it at your own risk. If you are going to get into your
radio with a hot iron, you should first get the real paper from
Kenwood with the drawing.

Kenwood Service Bulletin #ASB-1060 2 Pages
Subject: TM-733A PL Tone Distortion August 30, 1994

Symptom:

Transmitted PL tones at the receiving station have a relatively high
level of distortion. This is easily seen when the incoming signal is
viewed on an oscilloscope.

Countermeasure:

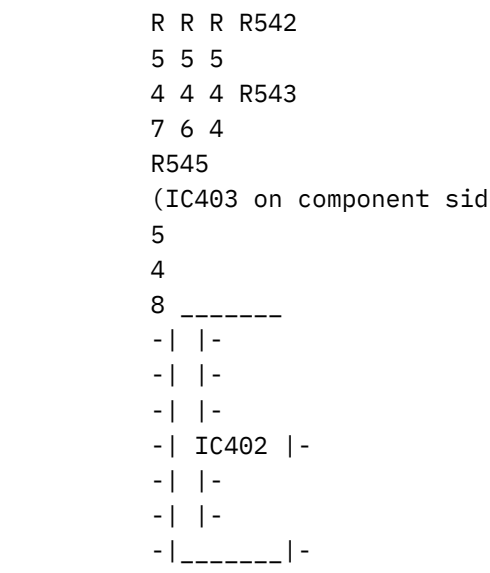
Change the value of the "Pull-up" resistors in the PL tone encoder
circuit as shown in the accompanying chart and illustration. This
reduces the distortion from around 9% to approximately 4%.

Part	OLD value	NEW value
R542	1.8k	2.7k
R543	1.8k	3.3k
R544	1.8k	4.7k

R545 1.8k 6.8k
R546 1.8k 10k
R547 1.8k 10k
R548 1.8k 10k

Procedure:
----
1. Disconnect the power cable, microphone and antenna's, etc.
2. Detach the front panel and set it aside.
3. Remove the top and bottom covers.
4. Remove the speaker and speaker mounting bracket.
5. Disengage the plastic front panel from the main chassis.
6. Carefully disconnect the two ribbon cables from the Tx/Rx unit C/4.
7. Remove the two Phillips head screws that secure the Tx/Rx unit to
the chassis.
8. Turn the circuit board over and replace the resistors using the
parts list and illustration as a guide.
9. Reverse steps 1-7 for reassembly.

TX-RX Unit (X57-4360-00) Foil Side View



Caution: This modification requires advanced surface mount soldering
equipment that is rated for CMOS circuits. It also requires
familiarity with advanced surface mount soldering techniques. If you
do not have the proper equipment or knowledge do not attempt this
modification yourself. Seek qualified assistance from your closest
Kenwood Service Center (Long Beach, CA, or Virginia Beach, VA).

The Service Manual specifies a test for the PL. The technician is
simply required to verify that any one PL tone is between 500 and 1500
Hz deviation. This is quite a wide tolerance range! The "standard"
PL tone deviation should be 750 Hz. Twice that strong might be too

strong and become audible. There are no trim-pots on the PL deviation, so I'm guessing that the deviation is pretty constant from radio to radio.

The dirty PL is definitely found on early models, but we have had many reports that the PL problem has been fixed in newer versions of the radio. If you purchased your radio after September 15, 1994, (or your serial number is greater than 55000000) it's a good chance that you may not have the PL problem.

The other problem concerns the DTMF Confirmation Tones. This feature is off by default (I wonder why :), while it seems pretty useful. To turn it on, press [PTT] + [Down] on the microphone while powering the radio on. This will generate short DTMF confirmation tones whenever you send DTMF over the air from the keypad. Unfortunately, it mangles the beginning of the outgoing DTMF tone! This is serious enough that most local repeaters can't detect the tone, or count it as two tones.

Get a receiver and listen to what you are sending out when the Confirmation tones are enabled. It sounds to me like they may be mixing the confirmation tone in with the real tone and getting some destructive interference. Just a guess, though.

I called a Kenwood technician (Ricardo) and worked with him on the phone to reproduce the problem there. So, as of today, this is a Known Problem, and they are looking into a fix. :-)

I am really curious to know what they would say if other folks called up and complained about this problem. Would they deny hearing about it, or would it really be a Known Problem? Might give some insight into the PL-noise denial thing anyway. :-)

Personally, I'm much more concerned about the noisy PL than the DTMF confirmation tones, since I can just shut those off and pretend that feature doesn't exist. If enough people call about the PL problem, maybe they will come out with a real fix and offer it under warranty to all the radios out there (since they're all pretty new). My guess is that it will involve a free TSU-8 tone decode module, but don't hold your breath. :-)

External DTMF Remote Control

The following procedure places the 733 in External DTMF Remote Control.

Note that this mode is different than DTMF Remote Mode. This mode concerns the control of the 733 with an HT, and not the microphone.

- Press Band Select and select the UHF band.
- Pick a UHF control frequency.
- Turn on the UHF DTSS function and select a tone sequence. (p. 89)

- Turn the UHF DTSS function back off.
- Press Band Select to move to the VHF band.
- Press [CONT SEL] to move control back to the UHF band.
- Turn OFF the radio, press and hold [CONT SEL] while turning the radio back on, then release [CONT SEL]. The S-meter scale and the DT indicators for the UHF band will begin flashing. The LOCK indicator will turn ON, and most front-panel keys (except PWR) will be disabled.
- To begin remote control, you should key the external radio and press the following key sequence: "Axxx#" where "xxx" is the preset DTSS code selected earlier.
- If the proper code is received by the 733, the beeper will sound and the DT indicator will stop flashing. The radio can now be remotely controlled using the function chart below.
- To return to standby mode, press "A#" on the remote radio.
- To return the radio to normal operation, turn the radio off, then press and hold [CONT SEL] while turning the radio back on.

Refer to this chart when using the TM-733 in "External DTMF Control".

1 2 3 A
T.ALT ON TONE ON CTCSS ON ENTER

4 5 6 B
T.ALT OFF TONE OFF CTCSS OFF TONE SEL

7 8 9 C
CALL VFO MEMORY REPEATER ON

* 0 # D
DOWN POWER LEVEL UP REPEATER OFF

There are no "shifted" functions. Just one function per button.
After you hit "B" for TONE SELECT, press * or # to go up or down,
and same is true when in VFO mode or in MEMORY mode.
Tones 7, 8, and 9 mimic the three buttons at the top of the 733 mic.

Pressing "C" places the radio in cross band repeat mode. You will recognize this because of the dots between Kilohertz digits.
After pressing "C", put the radio back into standby mode with "A#".
The 733 will now cross band repeat. To disable cross band repeat, place the radio back into the External DTMF Remote Control with "Axxx#".
If you can read through the lines, the 733 is capable of operating as a frequency agile remote base. Now Kenwood just needs a CW IDer!

Assembly Mode Test

In the TM-733 Service Manual, it describes a test mode that I haven't seen mentioned anywhere else. So, here's the scoop:

Entering Assembly Mode: [CALL] + [MUTE] + [Power On]
All LCD segments should come on. (To exit, power off.)

Press the [VFO] key. *This must always be done first*
The serial port is checked and "F" with "80" on the display indicates
test passed. "1" or "2" means failure.

Different keys now show different displays, with [LOW], [SHIFT],
[TONE], and [REV] also adjusting the backlight intensity.

Set the dials to minimum, then press the [MR] key. Each of the dials
shows the digitized level.

This looks useful for checking all the keys and dials when you suspect
a bad connection.

5248. Interfacecable for TS 850 S

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-24 10:36:33 UTC
From: Karl-Heinz.Merscher@uvw.uni-bayreuth.DE
Message-ID: <9410241036.AA05615@btv0x3.uvw.uni-bayreuth.de>
Source record: 223253

Hi out there,

does anybody have a connection schematic to built up the interfacecable for a Kenwood TS 850 S?? I=B4d like to connect my transceiver with my IBM=20 compatible PC.

Any suggestions??

In article <38bm5k$p3t@cville-srv.wam.umd.edu>, ham@wam.umd.edu (Scott Richard Rosenfeld) writes:

I had an Omni-5 for a year or two. I agree that it is a fine radio except for the HISS. This is a common problem with trying to make a good radio with inexpensive as the first priority.

The problem comes from trying to move all the selectivity as far forward in the signal chain as possible. This is good for reducing the effects of intermod from widely spaced interfering signals. The trouble comes when all the selectivity dollars have been spent early in the chain and there is a lot of wideband gain following the last truly selective IF filter. This wideband gain causes wideband noise to appear at the product detector along with the narrowband noise and desired signals. The way most older radios (with high dynamic range tubes in the front ends) are designed, the main (most narrow) selectivity comes late in the signal chain and does a good job of limiting wideband gain noise.

You are not the only one to notice this effect, and it is not limited to Ten-Tec radios. QST reviewers have been bayiong at the moon about this for years without much effect on the manufacturers. Until it costs the manufacturers sales volume (more like market share) not much else is likely to happen.

The present cure for such irritations is a DSP audio filter. I use a Timewave because of low time delay for their anti-random-noise routines.

Hope this helps.

I'll take credit for the first paragraph but I didn't write the next one
(Nokia Bag Phone.) The bit about the salesman telling you that your phone
is > 3 watts is true. Cellular phones, no matter what kind, brand, color,
whatever, are limited to *** 3 watts output *** Just like amateur gear
the FCC doesn't regulate the ERP from the antenna but the phone is limited
to 3 watts! This was more a safety consideration than an engineering
limitation.
High power microwave can have quite damaging effects close to the head
(eyes) or
pelvic area (you know).
If you can build a 20db antenna for your cellular, no problem, you would
have around 300 watts ERP and confuse every cell within 20 miles.

> . . . the solution to this is a DSP audio filter. . .

Any audio filter capable of band-limiting the radio's audio to the desired degree will do it; nothing magic about DSP here. Yes, a DSP implementation's ability to go after random noise within its passband can be a plus, but the lion's share of the improvement occurs through mere low-pass filtering because of the ear's tendency to hear hiss as high-pitched.

As a bonus, This also knocks down high-pitched audio from filter "blowby," if it exists. Some radios incorporate audio low-pass filtering for this reason alone.

BTW, if the object is aural CW reception, I disagree that high-pass filtering (and, by extension, band-pass filtering, since it amounts to low-pass and high-pass filtering combined) should be used at audio. We need to preserve a good deal of the low-frequency information in detected-CW audio--the keying thumps--to be able to understand the stuff well. Implementations designed to receive CW at, say, a 500-Hz pitch that roll off audio below, say, 300 or 400 Hz considerably lack punch as a result.

: I'm not entirely certain the organization is an unqualified advantage;
: people often list several unrelated things in one ad (for example, a
: Drake and a Ten-Tec), and choose one classification. This might cause
: something to be overlooked. I have been searching forever for an ICOM
: IC-402 transceiver (hint hint) and I end up reading _all_ of the
: classifications searching for one, not just ICOM UHF or ICOM WANTED.

I'd have to agree that the organization can be a two-edged sword. In
general I see it working well for major for-sale items, and less well
for the ham who has a junk box full of stuff to sell. I guess it
depends on the seller being willing to buy space for two ads if s/he has
two "big" things for sale.

I still like it. Too often, I've missed things on first pass going
through the yellow sheets that would be easy to find if they were better
organized. I guess I'm really saying that I applaud the Trader's
attempt to bring order to chaos :-)

Good luck David on finding that IC-402. Afraid I can't help you on that
one.

You could buy one of the various collector's books. Marty and Sue
Bunis have just updated theirs, to edition 3. It includes descriptions
dates, and approximate market values along with the photos. They
cover examples from most of the US radio manufacturers before 1960.

For the specialist, there is "Philco Radio, 1928 - 1942" which has
photos or illustrations from contemporary advertizing of all their
radios produced during the period.

: when the band is not open and overkill (sometimes) when it is. Remember
: it is easier to increase your range with a good antenna than with a power
: amp. QST recently had a really good article about powering your way to an
: s-9 signal - it's just not worth it!

The original comment that I made concerning a recently introduced
10Watt 6M FM rig was basically meant to say "gee, the state of the
art is such that providing something greater than 10 watts at 50 MHz
should not be a problem" (i.e. it should not increase the cost of
the radio substantially).

Yes, gain antennas are very valuable. You can *even* use them when you
are running greater than 10 watts and radiate an even stronger signal.
Yes, I can hit the local repeater with less than 10 watts. Yes, there
are QSOs to be made on 6M with less than 10W.

I guess I didn't realize running 30 watts was considered an irrational
lust for power these days :-)

When I was looking thru a complimentary copy of the A. R. T. that I
received a while ago, I noticed that at least some of the adverts that
listed two different manufacturers' products were listed twice. For
example under both Drake and Ten-Tec headings. I'm not sure if this
is policy or people actually paying for two ads....

: of copying that weak DX.

[deletions]

: All recent mods have been done by Ten-Tec. They should have improved
: the hiss problem somewhat, although I never heard the radio before
: the mods were done.

Okay, but if your radio is an OMNI V, do be sure they did the one mentioned in *QST*'s OMNI V review (Nov 1990 *QST*, p 33) under the Rough Edges subhead. That one, "incorporated into all production units since the spring of 1990," bears directly on just the type of hiss you mention.

That said, any radio that has wideband IF amplifiers after all of its signal-width selectivity and includes no audio rolloff is going to serve up some wideband IF hiss. My little old TS-130V, all of the signal-width selectivity of which comes from a single 8830-kHz filter, exemplifies this exactly. A bit of audio rolloff can help; a "tail end" IF filter"--after the AGC-detector pickoff point but before the product detector--is a good solution, issues of complexity, filter loss and group delay aside. An image-reject product detector is another neat idea.

The state of the art is there, but the economics aren't. 6m is a 'born
again' band, and it's gonna be a couple years before the manufacturers
figure out that maybe someone would want 50w on 50MHz at the touch of a
button. I remember some great 2m rigs that only had 10w, now 45-50w is
the norm, and Icom has the 736, 100w on 6m.

I'm currently working on a 200w amp, 10w in for just such a radio, my
Icom 726. I've found that for Es SSB, you really need at least 50w or
be working from a rare grid ;-). The local 6m repeater is behind quite
a few hills from me, I don't expext to use it unless I have a 100w or so.

>SG-230 tuner.

I use an SGC-230 with my TS-50 mobile installation and had to break down
and purchase the Kenwood DC power cord extension for about $30. It wasn't
too painful after I cut the cable in two :-). The good news is that both
ends of the cable are the relevant connector. It works fine and is
very nice having the entire installation controlled by the radio power
switch and has the added benefit of the automatic power down after one
hour without PTT. That could end up saving the battery since it's pretty
easy to accidently turn the radio on and leave the car.

One warning. The SGC-230 is a pretty good tuner and will manage to
force quite a bit of power into a short antenna which means it will generate
very high voltage on it's output. I managed to set fire to a Hustler
antenna mount by trying to tune up a 40 meter mobile antenna on 75 meters.
The SGC-230 did it but the base insulator broke down and literally caught
fire! The tuner is practical for tuning the entire 75 meter phone band
without stopping the car but certainly is a compromise. Know what
you're doing!

5267. Kenwood TH28A HT- For Sale

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-25 15:39:48 UTC
From: mellerso@uga.cc.uga.edu
Message-ID: <mellerso.19.00AB04CD@uga.cc.uga.edu>
Source record: 223281

For Sale :

TH28A- HT
Stock Battery
Charger
Original Manuals and Box
Soft Case
MFJ - Microphone

This rig is less than a year old and in excellent condition. It has been kept in the softcase, so it is excellent physical and electrical condition. Features 2M Xmit and 440 Receive, Extended Receive, Aircraft Receive, Alphanumeric display, etc., etc. This rig has not been modified. This has been an excellent HT for me. The reason for selling is to get a dual band rig. Asking $250.00 for all above.

If interested, contact me via email - mellerso@uga.cc.uga.edu

Thanks in advance

You need response down to 250 Hz if you want to preserve the 1 ms
rise and fall slopes of a properly shaped Morse keyed pulse. That's
something people using audio filtering for CW selectivity don't seem
to understand.

Hi Tony,
I have one of these radio's I bought new for $300.00 back in 1982. The
answer
to your first question is the 5 up means 5kc's, which means if you were at
145.150,the 5up switch would make it 145.155.
The display will read like this say you were on 145.150 Mhz, the display will
be 5.15
No this radio does not have a backup battery for the memory (bummer) Oh well
at the time I bought mine it was the best thing on the market ...hehe, Gee
how things change. Hope this helps you out

: Thanks in advance for any help!!

: --Jesse
: AB5XC
: formerly KC5HBY
:
Jesse-- I know what happened... It happened to me..
Inside the 02AT is a small relay which switches the power from the
battery to the 12 volt input when the 12 vdc is applied.

I dropped mine, and the relay stopped working. I had to order another
one from Icom... I don't have the number, but Icom will know which one.

It is a little blue relay mounted right under the top of the HT. It is a
SPDT relay and has five contacts- 3 for the relay and 2 for the coil.

I bet that is ur problem - Good Luck 73, Dit dit

dbarton@unix.cc.emory.edu wrote:
: Greetings fellow hams. I have a technical question regarding the setup
: for my first installation. I will be setting up an SGC-2000 HF rig
: which will be used with an antenna tuner, and (probably) a 26' whip
: antenna. I would also like to set up a VHF antenna to attach to my
: HTX-202, and hoped for future VHF base/mobile unit.

: The physical layout is as follows: The highest point on the roof is the
: chimney, and I would like to strap the mounting clamps for the antenna(s)
: to this. The only other alternative is mounting the bracket *behind* the
: eaves (this is a condo, and there can be no external scars when the
: antennas are removed in about a year). The problem is this. There is a
: good mounting site outside the window where the equipment will be, but
: that room is on the opposite side of the building from the aforementioned
: chimney. My question is, where is the point of diminishing returns for
: length of coax vs. height of antenna? If I mount the antenna(s) on the
: eaves outside the window where the equipment will be, I can get away with
: 15 feet of coax at the outside. If I mount the antenna on the chimney, I
: get approximately 6 more feet of height, but it will require about 60
: feet of coax. I know from my fledgling study (Tech- license) that the
: shorter the coax the better, but how much do I gain in performance with
: that extra 6 feet of altitude?

: A few other details of note, the building is near sea level, next to
: Mission Bay in San Diego, CA. There are hills close by (within 5 miles)
: in basically all directions, but the building has two stories, and is
: equivalent in height to the tallest buildings within sight range.

: I do have one other question. It will likely be necessary to sink a
: ground rod. Assuming that I will be able to mount the antenna on the
: chimney, it will be an advantage to place the ground rod on the same side
: of the building. Is it ok to run a ground wire for the equipment back to that
: side of the building, or will it be necessary to sink another ground rod
: where the equipment will be? Is this even possible, or do the antenna
: and the equipment need to be attached to the same ground for
: safety/propogation reasons?

: Many thanks for any and all help, e-mail responses are welcome, and I do
: check this group often if e-mail is not possible.

: On the road to General class...

: Doug
: KE6LZM
Doug:

Put the Ground rod nearest your rig... make the ground lead as short as possible, and preferably not resonant.

The antenna placement, relatively speaking, is not critical. Put it as high as possible, but also not near other structures. If the low spot is clearer, use it. The small height difference will not be noticable for those you listed.
The Coax losses are similarly not too critical on HF. On VHF, yes, the shorter "might" be a little better, but I doubt it
Use a good quality low loss Coax such as RG 8X (foam Core) or RG-213 .

Good Luck Have fun 73, de Pete K8UNP

Warren:

I've had a Diamond X-500 up for several years, and have been very pleased with it. I'm directly on a large body of salt water, so I had to have an antenna with a fiberglass radome. My previous antenna, a Ringo Ranger, was a useless hunk of corroded aluminum after 6 months. The Diamond has worked well, and even survived 75+ mph winds a couple of years ago.

I recently put up a Diamond V-2000 (similar antenna, but also covers 6M), and have been equally pleased with it.

Not mentioned is the following:

As a newcomer, I would jump on the shorter cable and keep it closer to
the shack. However, experience has shown that you want to put the
antenna further away from the shack. RF will get into everything,
especially with your "distant" ground. The further from the shack,
the better.

>that was a full 3 Watts. Maybe they still do. "Maximum power" was a
>boasted feature.

>> power class 2: portable phones (handhelds) max power is 8 dB less =
>> 0.6 watts.

>Blaupunkt regularly advertises their 1.2W handheld as being the most
>powerful handheld. Of course, this could be a high-gain antenna
>combined with deceptive marketing, but their talk-time seems to be
>shorter than most, so it could be true.
>
Yes. Hand helds are limited to 600mW. 1.2 is probably with a 3dB gain antenna.

>> All phones are capable of being dynamically powered down by the
>> cellular system to -28 dB of power class 0 (or 4.75mW)
>> nx7u@aol.com

Station class marks:

00 = 3 watts, 666 channel
01 = 1.2 watts, 666 channel
02 = 0.6 watts, 666 channel
04 = 3 watts, 666 channel, vox
05 = 1.2 watts, 666 channel, vox
06 = 0.6 watts, 666 channel, vox

08 = 3 watts, 832 channel
09 = 1.2 watts, 832 channel

10 = 0.6 watts, 832 channel
12 = 3 watts, 832 channel, vox
13 = 1.2 watts, 832 channel, vox
14 = 0.6 watts, 832 channel, vox

Notes: Programming a 666 channel phone with an 832 channel class mark may cause "handoffs" to channel the phone doesn't have.

Programming some handhelds phone with a higher power class mark (like 08 instead of 10) may result in phone attempting to go beyond it's rated power. Some will actully try to go to three watts - they might get halfway there and get real hot!

Motorola phones have a voice activated transmit feature to extend battery service. If the system you are using does not support vox, you may drop calls when you aren't talking beacause the supervisory audio tone (SAT) will drop. The network should tell the phone to disable vox if the class mark is seen.

I measured power output on my FT470 recently, and found the VHF side to
be transmitting about 60% of rated power. I called Yaesu and they said
the VHF module is going out and to send it to them. (It's only about
6 months old.) The tech said it will eventually go out entirely, but I
don't know if the receive will go out like yours has. The number for Yaesu
is 310-404-2700 if you want to call and get an estimate from them.

5285. Re: PLL for IC245-(E)

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-26 23:11:13 UTC
From: kenw@col.hp.com
Message-ID: <38mnmh$ftd@hp-col.col.hp.com>
Source record: 223208

The only source for the PLL IC would be ICOM, as far as I know.

Their address here in the U.S. is

ICOM America
2380 116th Ave. N.E.
Belleview, WA 98004

phone 206-450-6044 (parts order)
206-454-7619 (customer service)

Are you sure the problem is not simply a poor connection in the several little brass rivet connections which connect the top side traces with the bottom-side traces? Typical symptoms would include missing segments in the LED display, wrong frequency in the display, and other strange frequency/display-related trouble.

These brass rivets are a known problem for early IC-245 and IC-211 radios. The solder fails to join the brass with the copper traces over a long time period. Resoldering them will be a temporary fix; but the long-term fix would be to replace every one of them with short pieces of copper wires. Note that there are two or three -under- the PLL IC. This requires careful removal and replacement of the chip. Use an ESD wrist strap during this procedure.

5286. Re: PLL for IC245-(E)

I failed to mention that these brass rivets are found -only- in the PLL module. ...and yes, it takes a considerable amount of time to even open up this thing! Leave all the wiring connected and just let the module hang loose while you fix it.

I have a TH 22 and it is one heck of a good HT. Audio is excellent
and it outputs 3 watts with standard battery, 5 with larger one, and is
minute in size . Only lacks illuminated keypad, I guess Kenwood figured
we could program it in the light. I see the the Kenwood HMC-2 is the
Headset with VOX-PTT although I don't have a price for it. As far s
buying one buy or get a QST or CQ Mag and you will find dozens of mail
order firms. HRO or Tucher have been good for me. And the prices are
very reasonable.

Good Luck! Dave KA7HDN/AE

5289. Need Manual/Info on Gonset Communicator III

Message-ID: <38n1td$sge@lester.appstate.edu>
Source record: 223212

At a recent hamfest I succumbed to nostalgia and bought a Gonset Communicator III 2 meter unit because it was the first amateur radio I used over 30 years ago.

Can anyone out in netland furnish or suggest a source for a photocopied manual/schematic for the unit?
Also, there is no power cord. I remember that there was one power cord for primary AC power and a different power cord for 12 volt dc mobile use with the built in vibrator power supply.

Any info on the pin connections for the 110 and 12 volt connections?

Thanks in advance.

5292. Yaesu FT840 vs. ICOM IC728:Opinions Wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-27 03:33:18 UTC
From: Chris Arai <arai@rahul.net>
Message-ID: <CyBB7I.4D8@rahul.net>
Source record: 223216

I am interested in opinions as to the pros and cons of the Yaesu FT840 vs the ICOM IC 728. There doesn't seem to be much difference other than the receiver on the 728 is triple conversion vs double on the 840, and the 728 comes with built in FM coverage. The price difference is >$200.

What do you get for the price difference? I've seen the inside of the 840 and it appears to be well made, but it is lacking any conformal coating.

Any opinions will be appreciated.

thanks,
chris

5294. HELP: Conformal Coating HF PCBs

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-27 05:14:59 UTC
From: Chris Arai <arai@rahul.net>
Message-ID: <CyBFx0.9yz@rahul.net>
Source record: 223217

A friend of mine just purchased a Yaesu FT840 which she is putting in her boat for a cruise to the Carribean. Upon inspection of the radio, I see that it doesn't have any conformal coating on the circuit boards. Since this radio will spend its life on a boat in the Tropics, I suspect that conformal coating would be useful. My questions are:

1. What risks do I run by coating the circuit boards with a conformal coating (aside from voiding the warranty.)

2. What type of conformal coating is recommended, ie acrylic, urethane, etc.?

3. Will this actually extend the life of the unit, or will something that I can't coat actually fail first anyway?

Thanks in advance.

: dbarton@unix.cc.emory.edu wrote:
: : Greetings fellow hams. I have a technical question regarding the setup
: : for my first installation. I will be setting up an SGC-2000 HF rig
: : which will be used with an antenna tuner, and (probably) a 26' whip
: : antenna. I would also like to set up a VHF antenna to attach to my
: : HTX-202, and hoped for future VHF base/mobile unit.

: : The physical layout is as follows: The highest point on the roof is the
: : chimney, and I would like to strap the mounting clamps for the antenna(s)
: : to this. The only other alternative is mounting the bracket *behind* the
: : eaves (this is a condo, and there can be no external scars when the
: : antennas are removed in about a year). The problem is this. There is a
: : good mounting site outside the window where the equipment will be, but
: : that room is on the opposite side of the building from the aforementioned
: : chimney. My question is, where is the point of diminishing returns for
: : length of coax vs. height of antenna? If I mount the antenna(s) on the
: : eaves outside the window where the equipment will be, I can get away with
: : 15 feet of coax at the outside. If I mount the antenna on the chimney, I
: : get approximately 6 more feet of height, but it will require about 60
: : feet of coax. I know from my fledgling study (Tech- license) that the
: : shorter the coax the better, but how much do I gain in performance with
: : that extra 6 feet of altitude?

: : A few other details of note, the building is near sea level, next to
: : Mission Bay in San Diego, CA. There are hills close by (within 5 miles)
: : in basically all directions, but the building has two stories, and is
: : equivalent in height to the tallest buildings within sight range.

: : I do have one other question. It will likely be necessary to sink a
: : ground rod. Assuming that I will be able to mount the antenna on the
: : chimney, it will be an advantage to place the ground rod on the same side
: : of the building. Is it ok to run a ground wire for the equipment back to that
: : side of the building, or will it be necessary to sink another ground rod
: : where the equipment will be? Is this even possible, or do the antenna
: : and the equipment need to be attached to the same ground for
: : safety/propogation reasons?

: : Many thanks for any and all help, e-mail responses are welcome, and I do
: : check this group often if e-mail is not possible.

: : On the road to General class...

: : Doug
: : KE6LZM
: Doug:

: Put the Ground rod nearest your rig... make the ground lead as short as
: possible, and preferably not resonant.

: The antenna placement, relatively speaking, is not critical. Put it as
: high as possible, but also not near other structures. If the low spot is
: clearer, use it. The small height difference will not be noticable for
: those you listed.
: The Coax losses are similarly not too critical on HF. On VHF, yes, the
: shorter "might" be a little better, but I doubt it
: Use a good quality low loss Coax such as RG 8X (foam Core) or RG-213 .

Yeah but....what about the AT TUNE button etc.? I guess all you're doing
is providing power thru the plug. The data goes in and out serial. I don't
think the scheme is published anywhere. I thought it would be nice to know
for auto bandswitching a linear.

: transceiver for the 800 MHz band (the cellular phone band).

I wish I had seen this earlier. I just threw away a Cell Phone amplifier. It as a 1 Watt in 50 Watt our amplifier. It needed 4 amps at 24 vdc. I think the thing was built by AT&T. How you would get a mobile cell phone connected it this thing I would not begin to guess. I came of a local Cell site that was being upgraded a couple of years ago.

We do try to work with the least power for usable communications,
and typically run 5 watts or so for FM repeater use and local SSB & CW contacts. However, when the E-Skip is in, it's always nice to be able to have the option of breaking through a pileup (especially on FM) with 50 or 100 watts. A higher powered radio simply means that there's more options depending on conditions than a 10 watt radio. You can always turn the power down, but you can't use more power on a puny rig if it doesn't support it.

BTW: no need to get so nasty with these arrogant comments like "engage your brains". It shows a high degree of pettiness and arrogance which is not appropriate to the discussion at hand.

5308. HELP with RS HTZ-202

Message-ID: <38pd00$klp@vixen.cso.uiuc.edu>
Source record: 223234

Hello, See if I can offline this up to the group.. dialup is busy..

As erquested, I have put a couple of logviewers up on a couple of
systems for nos users ftp. They have been uploaded to:

inorganic5.chem.ufl.edu in the NOS directory.. and
mvmpc9.ciw.uni-karlsruhe.de in the gopher/public/incoming dir..
(i can only assume it will be moved t the nos dir..)

The files are the following:

logview2.zip (logview for versions that create one continuous logfile)
nosv_300.zip (logview for versions that create single daily logfiles)

These viewers are also available on a LLBBS for those who don't have
ftp access. Te board is called The Hook and Slice Club. The phone
number is 217-446-0105. They are located in area #14 which is the
"mystuff" area. They may also be file requested (freq'd) at 1:2460/6

A short desc follows...

Intro:

NosView pops up a window and allows you to select the log of
your choice to view. The highlighted file is the current days

log by default. While viewing the log you have the option to scroll
forward and backward or pan left and right through the selected
activities. NosView also gives you choices to print the activities
to the printer, save the activities to a file, shell to a batch
file where you may do anything you want or use a Paint and Save
option This will let you paint selected text and save or append
the text to a file.

Hope you enjoy...
if nothing else send him a message saying thanks and be sure and
pass along any ideas... to wbspicer@prairienet.org

Why anyone would want 50 watts at 800mhz buzzing around their head is beyond me. I thought only CBer's wanted high power to prove a point. The excess wattage on cellular will only be bumped down by the cell site anyway when it tells the phone to do a PLC because of receiver front end overload. Not to mention that you can cause some nasty co-channel interference to someone else on the same channel out in the distance...

Certainly it does. So what? It is not being used for automotive speed
measuring equipment - so your yelling is irrelevant.

: LASER RADAR CAN BE EASILY STEALTHED! ANY CAR CAN BE SET UP to absorb the
: infrared light. or use multi faceted material.

Uh,huh. And, just what are you going to use? Even black does not absorb
most of the infrared. Sure, you can reduce the returned signal - but
that is all. At 200-300 feet, you are not going to be able to reduce
it enough. Remember, unlike doppler shift speed measuring equipment,
the distance to the target does not matter materially.

I already responded to this in a previous posting. As I stated there,
your argument is immaterial. I am well aware of doppler laser, it has
been around for about 20 years. It is just that the laser speed measuring
devices do not use doppler, they are Time and Distance, and laser is very
good at measuring distance.

There may be an exception. I think it was Gary C. who stated that the
Georgia police have experimented with doppler laser.

Check your library for copy of the Amateur Radio Handbook. It has a
scematic for a practice key. You can find all the parts at Radio Shack.
Don't worry if you know nothing about electronics; putting it together is
very straightforward.

Casually assuming you have the proper license to use it as a transmitter,
there is a control setting procedure to enable transmit. It's in the manual
on page 31.

Of course, If you do not have an Amateur Radio Licesce issued by the
appropriate authority--don't even think about transmitting........

It is a nice, although somewhat limited radio that works very well in the
2 metre Ham bands. I have two of them, both heavily used.

Ted,

> ng about buying an HF Rig that is about 1000-1500 dollars and it should have an
> Antenna tuner.

Don't be deceived by thinking that the built in antenna tuners will do the job of an honest-to-goodness tuner. Generally speaking, the Japanese rigs with built-in antenna tuners have them because the final amplifiers use an SWR fold-back protective design and need to see an almost perfect 1:1 SWR. You might say that they're there to compensate for a design shortcoming. Also, the built-ins will only typically match an impedance range of between 15 and 130 ohms which isn't much good if you plan on using a non-resonant multiband antenna.

I'm pretty sure that what you want is an Amphenol 80MC2M.
I haven't bought one of these in a long time, but they used
to be available in most any industrial electronics house and
were certainly available at all ham radio type places. Times
have changed, and now all I see at the ham stores are 8 pin
Kenwood, etc. type plugs. I've got a feeling that you can
still get them at the commercial houses that carry Amphenol
connectors (or whatever Amphenol is called these days).

Sigh.

A very good friend of mine is legally blind and holds amateur call
W2KYM. He has problems reading the readout on his FT-890 and FT-757.
He relies on memory and hearing for the station(s) on his group nights.
Does anyone know if there is a voice readout availible or of a circuit
that has the capability of voice readout. Any help would be appreciated.

Hello everyone! I need your help.

I would like to conduct a survey of power-supply owners here on the net.
I will post the results after a week or two if anyone is interested.
Please send any replies privately to me here, or if you have E-mail
access send to "andy.moss@canrem.com". If you have more than one power
supply that's great and I'd love to hear about them all! Okay, here's
what I am looking for:

- Brand of supply and model number (of if you made it let me know!)

- Current rating if you know it

- Briefly why you chose this supply (or these supplies)

- Good and bad things (if any) about this/these supply(ies).

Thank you very much and I do appreciate it!

Cheers!

Andy

I have a TH 22 and it is one heck of a good HT. Audio is excellent and it outputs 3 watts with standard battery, 5 with larger one, and is minute in size . Only lacks illuminated keypad, I guess Kenwood figured we could program it in the light. I see the the Kenwood HMC-2 is the Headset with VOX-PTT although I don't have a price for it. As far s buying one buy or get a QST or CQ Mag and you will find dozens of mail order firms. HRO or Tucher have been good for me. And the prices are very reasonable.

Good Luck! Dave KA7HDN/AE

PS. The RS 202 has a bad reputation around here. Strongly recommend the TH 22 or look at the HT 11 Yaesu, but in similar size is puts out only 1.5 W. Dave

5342. For Sale: TS-50S, IC-725, Outbacker

Marv,

> At a recent hamfest I succumbed to nostalgia and bought a Gonset
> Communicator III 2 meter unit because it was the first amateur
> radio I used over 30 years ago.

I have a similar memory, only it was an original Communicator on 6 meters
and it was about 38 years ago.

You might enjoy ELECTRIC RADIO magazine. It's dedicated to vintage radio
hamming. PO Box 57, Hesperus, CO 81326, 303-247-4935 $28/year, $38 1st
class (and worth every penny!)

> Can anyone out in netland furnish or suggest a source for a
> photocopied manual/schematic for the unit?
> Thanks in advance.

Try W7FG Vintage Manuals, 3300 Wayside Drive, Bartlesville, OK 74006,
800-807-6146 or 918-333-7893

Also, "Sam" at Golden Age Radio in Baltimore collects Gonset Communicators
and may be able to help. (Remind him that he got his Civil Defense
6-meter Communicator from me!) They're closed Mondays and Tuesdays.

MH>I've looked at the Kenwood TH-22AT and like it for it's feature, size and
>flexibility. What are others' experience with this radio. I can get it
>for $262 - $20manuf. rebate; is that a good price.

MH>I am also intrigued by the Standard C108A.

Of THOSE two, the Kenwood is a vastly superior machine.

The COMPARABLE Standard HT is the C158A - with much better
power use specs, better sensitivity, and the best Customer Service
Department I could find.

>From: richard.krum@msfc.nasa.gov (Richard M. Krum, KE4GNK)
>Newsgroups: rec.radio.amateur.equipment
>Subject: Re: HELP with RS HTZ-202

R>It is a nice, although somewhat limited radio that works very well in the
>2 metre Ham bands. I have two of them, both heavily used.

"Somewhat limited"? It performs magnificently, and as advertised.

The HTX-202 has 12 independently-programmable memory channels, plus one
calling and three priority channels. It comes with continuous tone
squelch encode -AND- decode. Power output is 5 watts minimum (7w typical)
with 12 VDC supply, 3 watts @ 9 VDC or 2 watts @ 7.5 VDC. Low power
setting provides 1 watt output. A power saver circuit with programmable
1/2, 1/4, 1/8, or 1/16-second duty cycle. Batteries are compatible with
larger ICOM (IC-2AT/IC-32AT) series HTs.

Repeater offset can be adjusted from 0 to 4 MHz in steps as set by the
scan frequency step selection (5, 10, 20, 25, 50 or 100 KHz). Memories
store any offset, and any combination of continuous tone frequencies.

Supplied with Nicad battery, charger, 6-cell alkaline battery case,
antenna, wrist strap and belt clip. Features include:

* True FM modulation (not phase modulation) for outstanding
transmit audio and best performance in packet service.
* Continuous tone squelch transmit and receive tones are
independently programmable.
* In addition to DTMF dialing, there is 5-digit DTMF selective
paging (DTMF squelch).
* A five-number memory dialer that stores 15-digit sequences
for autopatch use or DTMF paging.
* Scan for either active -- or vacant -- channels, with
programmable scanning step of 5, 10, 20, 25, 50 or 100 KHz,
and upper and lower scan limits (for VFO scan.)
* FAST, 25 channels/second scanning.
* Selectable priority channel scan interval, every 4, 8, 12 or
16 seconds.
* Multi-function scanning lets you scan standard memories,
priority freq. memories, or a frequency range. Resume can be
after 10 seconds, when carrier drops, or remain on channel
(don't resume.)
* Transmit timeout - if you frequently time-out your local
repeater, this circuit will stop transmitting after a preset
delay (30, 60 or 120 sec.) and sound a beep. In effect, it

forces you to reset the repeater before the repeater times out.
Of course you can disable the timeout circuit.
* The HTX-202 carries a 1-year parts and labor warranty.

It ain't pretty. It doesn't have 200 channels. But it is a workhorse of
an HT.

There was a hash suppression condenser (the auto world still uses
quaint terminology) on the field terminal of the old alternator.
Did you transfer it to the new one?

Gary

From: rafaels@zimmer.CSUFresno.EDU
Message-ID: <CyGzzt.7rA@zimmer.CSUFresno.EDU>
Source record: 223166

I have the FT5100 for about a week now. So far an excellent radio. I use it as a base and packet station and it does an excellent job (it has a buil-in TNC jack in the back). I also looked at the Icom 2340 but I did not buy it since it does not have an antenna duplexer (it has 2 antenna connections on the back, so you either have to have 2 antennas -1 for 2m and 1 for 73 cm- or buy an optional antenna duplexer -an extra $30-$50-). This one was the main reason I did not buy the ICOM. I did not look at the Kenwood. My $.02.

Ne> I've got a dual band ht (Yaesu FT-530), and am very happy with it. I'm
Ne> shopping for a dual band mobile now. Any opinions on the FT-5100,
Ne> Kenwood 733A, or Icom 2340? If you're using any of these radios and
Ne> have an opinion good/bad, I would appreciate some feedback (no pun
Ne> intended). Thanks. Terry VE4UC

I have an Kenwood 733. I use it primarily for packet at home, though I've used it mobile a little. I like the radio -- it's very flexible and has lots of functions. Over the years, I'd keep saying "I wish my radio would do 'x,' and the 733 does much of what I'd been wishing for.

That versitility means complexity, however. The radio has nearly 100 pushbutton and combination-pushbutton functions. 15 of them are documented on the buttons or the front-panel display. That leaves a lot of functions to try to remember. I've made a "cheat-sheet" from a function list previously published on the net to help me remember some of the lesser-used functions.

"Guessing" at a function, particularly a multi-step function, can get you stuck with a parameter set you don't want (like limiting the range of the VFO, or locking out the transmitter), and until you haul out the book, you can't get un-stuck... except...

...there are six special "programmable memories" in addition to the 70 standard memories, shared between VHF and UHF. The programmable memories remember almost all of the 100 function settings, so if you really bollix the radio up trying to guess a function, you can return to one of those programmable memories and start over.

My most serious complaint is poor intermod rejection. I live in Raleigh, NC, not a major megalopolis. I'm on a ridge, one of the higher spots in the county, so within a mile of me are several towers, with lots of RF, particularly paging transmitters with a few kW ERP. I have a tall mobile whip on a vent pipe on the roof as a base station antenna.

When I connect an HT to that antenna, many channels are "blown away" by paging and commercial voice intermod. Even when I'm not hearing the intermod, the HTs are desensitized, and receive poorly. My voice base-station is an Icom 2410. It hears almost no intermod on VHF, and none at all on UHF, and seems to maintain full sensitivity. The 733 falls in between -- a few specific frequencies hear paging garbage "S-9," a few others hear weak trash, but most of the band is clear. Sensitivity seems OK.

The 733 has a feature called "AIP (Advanced Intercept Point)," that is supposed to reduce intermod. And it does. Turning it on will drop all

signals 5 or 10 dB, and drop intermod maybe 10 to 20 dB. You lose the weakest signals when you turn it on, and the weaker intermod goes away.

Anyone reading this will have to try to decide for themselves what their "intermod" situation is like. My guess is the radio would be pretty bad used mobile in the major city downtown areas, but everywhere else, no problem.

There have been some excellent postings on mods and bugs here in the Ham Tech newsgroup. If you can recover them, you should.

>capacitor through individual cells (if possible) or entire packs.
>I can oftentimes "fix" a cell that was dead-shorted so that it
>seems to take and hold a reasonably charge.

>But it also seems that such "fixed" cells seem to regrow their short,
>so, most of the time, it is a temporary fix.

A friend of mine has used a 100uf, 400v cap charged to 350v.
I've used a 200uf charged to 100v.
Each cell must be zapped individually, and the cell tested with a meter
after every zap... As soon as the cell shows voltage (even 100mv) go to
the next one. When you are all done go back and re-meter each cell.
They all should show some voltage. Let the pack sit for a few hours
before you drop it in the charger.

But yes, zapping is a temporary fix. I think of it as buying time
while money is saved for a new battery or insert.

Funny,

I just received my Technichan lisence TODAY and was just about to
ask the same question about the 2m transreceivers myself (Small world!
what a coincidence!!!)

Anyways, looking around in the market with a new eye (of a
licensed HAM) Radioshack 2m's seem to be a good package as far as I have
seen. Actually, because I couldn't wait to try out my new found freedom,
I went ahead and bought the trans/receiver couple of days after I took my
test!! Any ways, I returned the unit because I thought it would be wiser
for me to try out all the functions that came with it when I had my
tangiable license, lamented, and sitting pretty on my apartment wall!! :)

If anyone else outthere has info or suggestions please post them. we are
both eager to join in the fun!

I can be reached at
zolfagha@cs.ucdavis.edu

I am new to your family,

My first name is ARASH (KE6NKW),

Eversince my younger days, I have always been fascinated by electronic components and gadgets. Living in Iran from 76-86 I started to build kits, electronic gadgets, sold by a company called Mehran Kits. It was a small company located on teh second floor of an old downtown shopping area in Tehran. Coming to the US in 86, I did not continue this wonderful hobby 'till this year when my father, (who had been a ham for a long while since his University days), and I (who is just starting his university days !!) decided that Amateur radio would be the perfect thing to have as hobbies (since it would also help me get exposed to more engineering material not covered in my undergraduate studies here at UC Davis)

In any case, My reason for writing my life history here was to ask my new found family of HAMS a favor. I am looking for any large name companies who can provide an amateur (Computer/ Electrical) Engineers tools to continue his long lost hobby. I know for fact the Heath, the biggest company which my dad still has hundreds of WONDERFUL catalogues from, is GONE, HISTORY, CAPPISH!!! So I am looking for any other well known companies, possibly in the west coast. I really appreciate the help and hope to someday understand most of the technical words written in this and other news groups about Amateur radio ;)

Sincerely,
Arash Zolfaghar

The w21a has no keypad. The W21AT does. Both are pretty
similar, but the W21A is a bit harder to program given the lack of
direct entry.
At the current Tucker price, the radio is a bargin if you can
live without the keypad. 73 Dave AA5NU

The Standard C108A is a very unusual radio. It has flea power
transmitt, useable if you are close to a repeater, but much too low to
be your only radio. The C108A, however, has one of the finest
receivers I have ever used. It is a nearly perfect rig for
the traveler who likes to listen to the 2 mtr chatter in a hotel, but
who plans to do little or no transmitting. The transmit audio on the
rig, by the way, is excellent. The 108A also has a hot airband
receiver and some folks use them to listen to airport comms while
traveling to pass the time. It is so smaull, it has also been used by
friends who travel a lot internationally to "smuggle" in inside their
briefcases, with the antenna removed, to countries that don't
appreciate people carrying HTs. Again, they use it to listen with no
plan to do much transmitting.
A list nice feature of the 108A is that it only requires two
AA batteries to run it a long time. Again, very nice for the traveler.
I thought mine was over-priced when I bought it, but now I would not
part with it.
If anyone else uses this radio, I would enjoy swapping ideas on
features not shown in the manual.

On Oct. 29 my wife and I passed out No-Code Tech test! Now we are out to pick up two hand held 2 meter radios. As some of you netters know, we are planning to use them for snowmobile communication. I'd first like to thank all the folks that have given me tips and suggestions. They have been very useful. Now for another comment and question to netland.
I have learned of a push to talk mic that goes in ones ear and a local snowmachiner/ham has used it with great effectiveness on a Kenwood 22AT so at the very least we can get set up with that rig. As he explained it VOX would be a pain in the butt to set up and would require filters to try to remove the noise of the engine. The questions are:
How would one remove audio like engine noise and still pass voice "noise" through? Can one actually distinguish, electronically, between the frequencies of a screaming snow machine and a screaming person? If such filters exist, where might I find them? Is anyone familiar with a specific VOX set up that they might recommend for snowmachine/helmet use? It would have to be throat mic or an earplug mic to keep the mic from freezing over with my breath, I think.
Any replies are appreciated. I can't get on Usenet so please reply via this mailing or directly to me personally. Thanks.

RS>I have the FT5100 for about a week now. So far an excellent radio. I
RS>use it as a base and packet station and it does an excellent job (it
RS>has a buil-in TNC jack in the back). I also looked at the Icom 2340
RS>but I did not buy it since it does not have an antenna duplexer (it
RS>has 2 antenna connections on the back, so you either have to have 2
RS>antennas -1 for 2m and 1 for 73 cm- or buy an optional antenna
RS>duplexer -an extra $30-$50-). This one was the main reason I did not
RS>buy the ICOM. I did not look at the Kenwood. My $.02.
RS>73 de Rafael, KE6JSR

Rafael, I have an FT5100 and think it is quite an excellent radio.
I too like the built-in duplexer. I don't blame you for not
looking at the Kenwood. Generally, they are of lesser quality than
Yaesu and Icom and I have been told that their service dept.
personnel's attitudes really suck! Stick with Yaesu!!

I need a manual, or at least a schematic, for a Hewlett Packard model 403B RMS voltmeter. It's an average responding, RMS-reading, AC voltmeter. It's used as a stand-alone unit, although also was a component of the HP3550B test set (which included this, a patch panel box, and a variable oscillator). Thanks for any help! 73 de WA8MCQ

I bought a new Pasokon at a hamfest on Saturday and when I got home, there was NO SOFTWARE in the box. I think the guy was so busy talking to everyone who was interested that he forgot to give me the disk, and I assumed it was in the box. Anyway, does anyone have any idea where I can get a quick copy of it? I will send the registration in at noon, and I'll get a copy from the guy who wrote it that way, but that will take a week or more and I can't wait!!!

Thanks for any help with FTP sites or anything..

5362. How's the IC-2700 Performance?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-31 05:46:30 UTC
From: bobw@col.hp.com
Message-ID: <3920bm$6ne@hp-col.col.hp.com>
Source record: 223182

Anyone out there have experience with the ICOM IC-2700?
I am particularly interested in its receiver "intermod"
performance. It seems to have the right specs & features but
many of the late model dual band radios have anemic receivers.

Any other comments on this or other dual band radios are
welcome.

Thanks,

Bob

Hi,

I have the oakland mods - keyboard and diode mod. It opens up the lower bands from 110-200, but the upper is still 440-450. Is there another trick that I am missing? Thanks...

Mike

5364. Icom R-7100: How to remove tuning knob?

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-31 13:27:36 UTC
From: dseitel@crl.com
Message-ID: <392rc8$ebh@crl7.crl.com>
Source record: 223185

I sent my R-7100 into Icom's service place a while back and there's a smudge on the inside of the S-meter that looks like a fingerprint. I'd like to get it off. It looks like I have to take off the tuning knob to get at it.

After removing the rubber cover on the tuning knob, there is what looks like a concave-headed screw in a hole in the tuning knob. No easy way to get any purchase on that strange screw.

Can anyone tell me the proper way to remove the tuning knob?

David S. Eitelbach

5365. GE Phoenix Prog. Info.

Newsgroup: rec.radio.amateur.equipment
Date: 1994-10-31 14:53:44 UTC
From: lapp@waterloo.hp.com
Message-ID: <3930do$a37@hppadbk.waterloo.hp.com>
Source record: 223187

I'm the proud owner of a GE Phoenix SX mobile radio. I'd like to "convert" this for use on 440 MHz. According to the service manual this "conversion" looks pretty simple since the model I've got is supposed to handle 440-470 MHz.

The version I have supports 2 channels and with a few external components I can make it have 16. The channel information (Rx & Tx freq. CTCSS etc.) is programmed into a Xicor X2212 EEPROM. I can take the radio to a local shop and get it reprogramed for $30 but I'd rather not have to to do that everytime I want to add a new repeater. I can program this part but I need to know what format the data takes. I had hoped that the format would be "obvious" and I'd be able to figure it out from the existing data. Unfortunately it isn't that obvious.

I think I've determined how the Rx freq. data is stored. You might expect that the Tx freq. data would have a similar format (I did!) but either I'm wrong about the Rx freq. data or EEPROM is corrupt because I can't make sense of the data in the locations that I think should contain the Tx data.

So: Can anyone tell me the format of the data in the EEPROM for this radio ?

Thanks,

Dave Lapp

I've also got the FT5100 and really like it. It offers a good value for
the money. I also purchased the optional tone decoder board.

All in all, I'm very pleased with the unit.

Hello all, just a little question to ask to all of you more knowledgeable Hams,
I have a IC-215 (3wPeP) that I want to use for packet radio with an amp.
However, the infoprmation that I have on the unit states that it was the " FM g
rabber, from 146-148 Mhz. Since the Packet freq is 145.03.. I think I have a p
roblem.. How can I modify this radio to run on the 145.03? It might be a simpl
e as getting the correct Xtals and dropping them in but I do not think so...
Thanks
